## Supplementary information

Distribution of additional nifH clusters. Compared to the dominant clusters P1, P4 and P8, clusters P2, P3, P6 and P7 showed lower nifH abundance. Nevertheless, they show a specific distribution along vertical and horizontal gradients with generally higher abundances at $16^{\circ} \mathrm{S}$, where N/P ratios were close to zero in surface and the OMZ had high $\mathrm{P}^{*}$ values reaching $2 \mu \mathrm{M}$ (Fig. S1).

## Effects of $\mathrm{O}_{2}$ and $\mathrm{NO}_{3}{ }^{\mathbf{2 -}}$ on the distribution of nifH clusters.

To investigate the effects of parameters $\mathrm{O}_{2}$ and $\mathrm{NO}_{3}{ }^{-}$, which had been dropped from the RDA model during stepwise selection but are generally assumed important factors for $\mathrm{N}_{2}$-fixation, we additionally evaluated a model comprising those two variables (Fig. S4). While the overall model and above-stated marginal effects remained significant, marginal effects attributed to $\mathrm{O}_{2}$ and $\mathrm{NO}_{3}{ }^{-}$were insignificant $\left(\mathrm{P}_{\mathrm{O} 2}=0.162, \mathrm{P}_{\mathrm{NO} 3_{-}}=0.553\right)$. (Variance inflation factors were generally higher than in the parsimonious model and $>5$ for $\mathrm{PO}_{4}{ }^{3-}$ and $\mathrm{O}_{2}$. Explained variance improved by $0.2 \%$ compared to the parsimonious model $\left(\mathrm{R}_{\text {adj. full }}^{2}=9.0 \%\right)$. The full model produced five constrained axes, the first three of which bundled about $84 \%, 12 \%$, and $3 \%$ of the explained variance, respectively. The first and second RDA axis is shown in Fig. S3.), although an RDA with $\mathrm{O}_{2}$ and $\mathrm{NO}_{3}{ }^{-}$as the only explanatory variables would also be significant (not shown), our results suggest that both their effects can be substituted by the effect of $\mathrm{PO}_{4}{ }^{3-}$ in the parsimonious model with negligible loss of explanatory power.

Analysis of glucose and $\mathrm{O}_{\mathbf{2}}$ addition effects. Effects of glucose and $\mathrm{O}_{2}$ addition on N fixation and gene abundances of selected novel clusters were analyzed in R. The systematic part of all models consisted of both factors and their interaction term ("Response variable $\sim$ Glucose $+\mathrm{O}_{2}+$ Glucose: $\mathrm{O}_{2}$ "). Standard analysis of variance based on ordinary least squares was not applicable due to strong heteroscedasticity of residuals in all fitted models. Therefore, generalized least squares were used for the modelling of N fixation and cluster P 4 gene abundances with function gls of the R package nlme ${ }^{4}$. This method allowed for different standard deviations per Glucose and $\mathrm{O}_{2}$ level, respectively, chosen using the Akaike Information Criterion (AIC). Likewise, to model P7 gene abundances, a generalized linear model (function glm of the stats package) was employed. This was based on a gamma-distributed response variable with a log link between the stochastic (response variable) and systematic model parts. Since such a model requires a positive response variable, an arbitrary small constant $\left(10^{-10}\right)$ was added to all P7 gene abundances to avoid zero values. Visual analysis of residuals revealed no adverse patterns in any final model.

Table S2: Summary of statistical analysis of the response of N fixation and cluster P4/P7 gene abundances on glucose and $\mathrm{O}_{2}$ addition. GLS, generalized least squares; GLM, generalized linear model. Degrees of freedom were 8 for all t -value test statistics. t -values and corresponding p -values are marked in bold-type for effects significant at the 5\% level.

${ }^{\text {a }}$ different standard deviations per Glucose level
${ }^{\mathrm{b}}$ different standard deviations per $\mathrm{O}_{2}$ level
${ }^{c}$ gamma distribution with log link; constant $10^{-10}$ added to avoid zero values

Fig. S1: Distribution of $\mathbf{O}_{2}, \mathbf{P}^{*}, \mathrm{NO}_{2}{ }^{-}$and novel nifH clusters: $\mathrm{P}^{*}, \mathrm{NO}_{2}{ }^{-}(\mu \mathrm{M})$, nifH clusters $\mathrm{P} 2, \mathrm{P} 3$, P6 and P7 and total nifH ( $\log _{10}$ copies $\mathrm{L}^{-1}$ ), the oxycline (concentrations in $\mu \mathrm{M} \mathrm{O}_{2}$ ) is indicated with white contour lines along (A) $10^{\circ} \mathrm{S}$ and (B) $16^{\circ} \mathrm{S}$.

Fig. S2: Depth integrated horizontal distribution of functional key genes of $\mathbf{N}$-loss processes and $\mathbf{N}_{\mathbf{2}}$ fixation in the upper 350 m in the Peruvian OMZ : archaeal $a m o A$ (functional marker for archaeal ammonia oxidation), nirS (functional marker for denitrification), hzo (functional marker for anammox), nifH for diazotrophs clusters P1, P8 and total nifH ( $\log _{10}$ copies per L). The section shows the vertical distribution of the dominant nifH cluster P8 ( $\log _{10}$ copies $\mathrm{L}^{-1}$, measured by qPCR) along a

North-South transect at $85.83^{\circ} \mathrm{W}$ as indicated by the black box on the map, the oxycline $\left(\mu \mathrm{M} \mathrm{O} \mathrm{O}_{2}\right)$ is indicated as contour lines.

Fig. S3: Absolute abundances of individual nifH clusters mapped onto the sample points in the parsimonious redundancy analysis (RDA) model (see Fig. 4). The area of the circles is proportional to ln+1-transformed nifH cluster abundances (see scale insert in the upper-left panel). Fill color corresponds to the respective nifH cluster color in Fig. 4. Samples with zero-abundance of a respective nifH cluster are represented as grey dots.

Fig. S4: Redundancy analysis (RDA) of Hellinger-transformed nifH cluster abundances. (A) The distance biplot (scaling) shows relations between samples (weighted sums of species scores) and environmental variables in the full model. (B) Correlation biplot (scaling 2) shows relations between nifH cluster vectors and environmental variables in the full model.

Fig. S5: Vertical profiles of $\mathbf{N}_{\mathbf{2}}$ - fixation: (A) Water column $\mathrm{N}_{2}$ - fixation determined by $24 \mathrm{~h}{ }^{15} \mathrm{~N}_{2}$ incubation experiments along the initial vertical distribution of nifH clusters P1 and P4 at station \#3 (Fig.1, map, $10^{\circ} \mathrm{S} / 81.3^{\circ} \mathrm{W}$ ) and (B) along $\mathrm{O}_{2}$ and nutrient gradients.

Fig. S6: Vertical profiles of $\mathbf{N}_{\mathbf{2}}$ - fixation: $24 \mathrm{~h}{ }^{15} \mathrm{~N}_{2}$ - incubation experiments at two stations at $10^{\circ} \mathrm{S}$ (\# 805 at $79.134^{\circ} \mathrm{W}$ is marked with black triangles, and $\# 811$ at $81.361^{\circ} \mathrm{W}$ with open circles).

Fig. S7: $\mathrm{N}_{2}$ - fixation was triggered in incubation experiments ( $\# 807,10.001^{\circ} \mathrm{S} 78.38^{\circ} \mathrm{W}, 20 \mathrm{~m}$ depth) by glucose and glucose/ oxygen addition

Fig. S8: Correlation of nifH P1 and $\mathrm{NO}_{2}{ }^{-}$: $\mathrm{NO}_{2}{ }^{-}[\mu \mathrm{M}]$, nirS, hzo and amoA sections section overlaid by P1 $\left[\log _{10}\right.$ copies $\left.\mathrm{L}^{-1}\right]$ indicated by dashed white contour lines.
