## 1. Participants

Name	Domain	Institution
Ruhland, Götz	Chief scientist	MARUM
Busack, Michael	Technician	OPTIMARE
Cianca, Andres	Marine Chemistry	ICCM
Dehning, Klaus	Technician	MARUM
Kalweit, Holger	Technician	MARUM
Klar, Steffen	Technician	MARUM
Kopiske, Eberhard	Technician	MARUM
Motz, Jürgen Markus	Engineer	DEVELOGIC
Llerandi, Carolina	Marine Chemistry	ICCM
Villagarcía, Marimar	Marine Chemistry	ICCM

DEVELOGIC: Company for hydroacoustics

ICCM: Instituto Canario de Ciencias Marinas

MARUM: Marum, Center for Environmental Research, Univ. Bremen

OPTIMARE: Company for marine sensors

## 2. Research Objectives

One of the most important upwelling systems in the world is situated in the area of the NW african coast. Due to the high amounts of Sahara dust influencing the transport of nutrients into and their concentration in the ocean, the area plays a major role for the particle production in the ocean and influences the processes of the biological carbon pump system. Despite the main driving force for climatic variability located in the North Atlantic, the upwelling area off NW-Africa is suitable to reconstruct the past climatic variability by monitoring present in-situ environmental changes and variations.

The research topics carried out were in correlation with the project MERSEA (Marine EnviRonment and Security for the European Area – Integrated Project). The main aim of MERSEA is the data management and processing to take aim to the needs of scientific end-users.

The participating institutions during R/V POSEIDON cruise 360, MARUM/University of Bremen and ICCM, are involved in work package 3. They will ensure the availability of real time and delayed-mode and regional in-situ data and products in the form required by the MERSEA modelling, data assimilation and validation systems. The activities are partly research and development, innovation, and partly demonstration. The served research sites, continued from the preceding ANIMATE and DOLAN projects, are DOLAN/ESTOC, Canary Islands; PAP, Porcupine Abyssal Plain; CIS, Central Irminger Sea. The main task during the POS 344-2 cruise will be the work on the DOLAN site. The DOLAN station is located 25 nm west of ESTOC and comprises technical devices for transmission of scientific data sets via satellite into the research institutes which collect the data in a database and make them available in the internet.

## 3. Narrative

R/V POSEIDON left Las Palmas in the afternoon of Oct 29<sup>th</sup>, 2007 and steamed to the ESTOC position (Fig. 1). At arrival the ESTOC monthly monitoring work was done (2 CTD casts). After finishing the CTD work four NOAA drifters have been released at the location. Overnight RV “Poseidon” steamed to the westerly situated DOLAN buoy position.

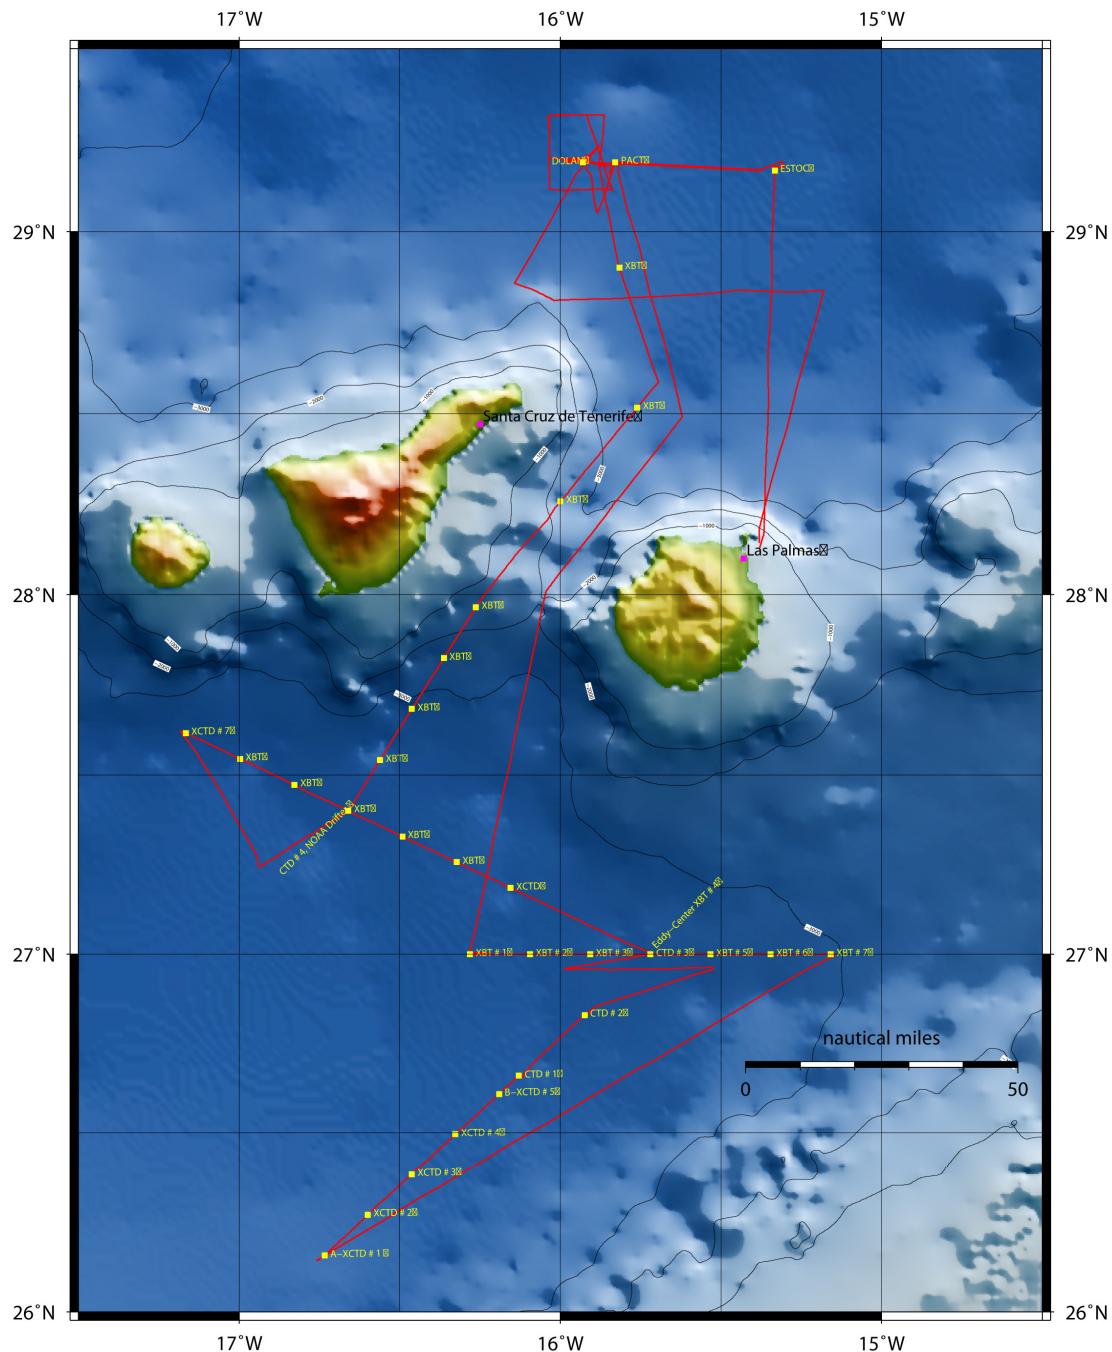

The next morning (Oct. 30<sup>th</sup>, 2008) the recovery of the buoy mooring started. Due to the fact that the mooring cables broke at 100m water depth the buoy was drifted away some weeks after deployment. It was caught and brought to the ICCM for maintenance. The residual rest of the mooring has been successfully recovered until noon. Afterwards the work was continued with the deployment of short-time acoustic mooring for testing purposes of acoustic modems. Overnight RV “Poseidon” steamed to the beginning of a planned CTD transect starting southwest of the DOLAN position.

On Oct. 31<sup>st</sup>, 2008 the CTD transect should start. Due to technical problems the CTD/Rosette could not be used. Instead a transect of XBTs and XCTDs started until noon of the following day (Nov. 1<sup>st</sup>, 2008). This work was followed by four CTD stations and several XBT/XCTD stations until Nov. 4<sup>th</sup>, 2008, 0:00h.

The following morning of Nov.4<sup>th</sup>, 2008 the recovery of the acoustic short-time mooring at the DOLAN position had been accomplished. In the afternoon the maintained buoy mooring had been deployed with an installed dummy buoyancy in the surface position. In the late afternoon a CTD cast followed which is necessary as pre-calibration for the Microcat CTDs of the buoy mooring.

Nov. 5<sup>th</sup>, 2008 started with the successful exchange of the dummy buoyancy against the buoy and the installed sensors. Afterwards a mooring was deployed close to the buoy's position containing an acoustic modem. It was planned to use this mooring for a test with a half year duration to transmit data acoustically from the bottom to the buoy and relay it via satellite.

In the early afternoon the scientific work was finished and RV "Poseidon" steamed towards Las Palmas where it arrived the next morning.

**Fig. 1: Course plot and stations of the Poseidon cruise Pos-360.**

## 4. Equipment Development and Tests

### 4.1 DOLAN Surface Buoy (SBU)

The Surface Buoy Unit (SBU) operates since 1997 and was formerly part of the DOMEST project. The unit can carry several meteorological sensors, satellite telemetry links and sub sea telemetry links like ORCA acoustic modem and now a cable telemetry down to 100m.

The DOLAN SBU unit with the upper 100m of the mooring was broken in April 2007. The buoy and all sensors have been recovered by the Spanish Coast Guard some days later.

The buoy and the sensors were refurbished during the first days of the POS-360 cruise. All sensors, the telemetry and the power supply were working well after.

The rest of the DOLAN mooring was completely recovered on the Oct. 30<sup>th</sup>, 2007.

The last routine maintenance has been carried out during R/V Sybilla S. Merian cruise MSM04-4b in March 2007.

The redeployment of the whole DOLAN SBU mooring took place on the November 5<sup>th</sup>, 8 days later.

There were no major damages visible on the buoy, all antennas, solar panels and cables on deck were in a good shape.

#### *Status of the DOLAN Buoy before maintenance*

The visual inspection of the buoy's body shows cracks and damages at 8 different locations. The visible damage has been repaired. Some more serious repairs can be expected for the next cruises.

- The wind sensor and the compass were working fine during the tests.
- The air pressure sensor has been working well all the time and the data was in the online telemetry during the whole past mooring period. This sensor has not been replaced.
- The weather sensors with relative humidity and air temperature were working well.
- The DOLIX GPS including antenna was working well.

The maintenance of the buoy electronics shows that the buoy was in a good shape. Both, 12V and 24V power supply were working well.

#### *OFFLINE data retrieval*

All data which has been sent via Iridium telemetry and all the offline data have been stored in the buoy. All the data has been read out successfully after recovery.

The data was sent to the responsible project partners (NOC / IFM-GEOMAR).

The online data is also available in an MySQL database.

The calibration for the Microcats took place at November 4<sup>th</sup>, 2007.

All the data has been downloaded successfully and sent to the responsible partners.

#### *Overview on the installed sensors / telemetry since November 2007*

A Fluorometer has not been received for this cruise. The 100m sensor pack contains a nutrient analyser and a Microcat.

**Table 1: Status list of used sensors on the SBU.**

Sensor	Telemetry	Status
Vaisala PTU200 - air temperature - relative humidity - barometric pressure	ORBCOMM	ONLINE
Vaisala WS245  - windspeed  - winddirection	IRIDIUM	ONLINE
TCM2  - buoy heading  - pitch and roll for the buoy	Working, delivers data for wind speed calculation	(indirect ONLINE)
Thrane & Thrane  - GPS	INMARSAT	Not installed because of interference with Iridium telemetry
Microcat @0.5m	ORBCOMM	ONLINE
Microcat @10m	Not in telemetry	OFFLINE
Microcat @100m	Not in telemetry	OFFLINE
Fluorometer	Not in telemetry	OFFLINE
Nutrient Analyser NAS-3E	Not in telemetry	OFFLINE
DOLIX GPS	IRIDIUM	ONLINE
Orbcomm GPS	ORBCOMM	ONLINE

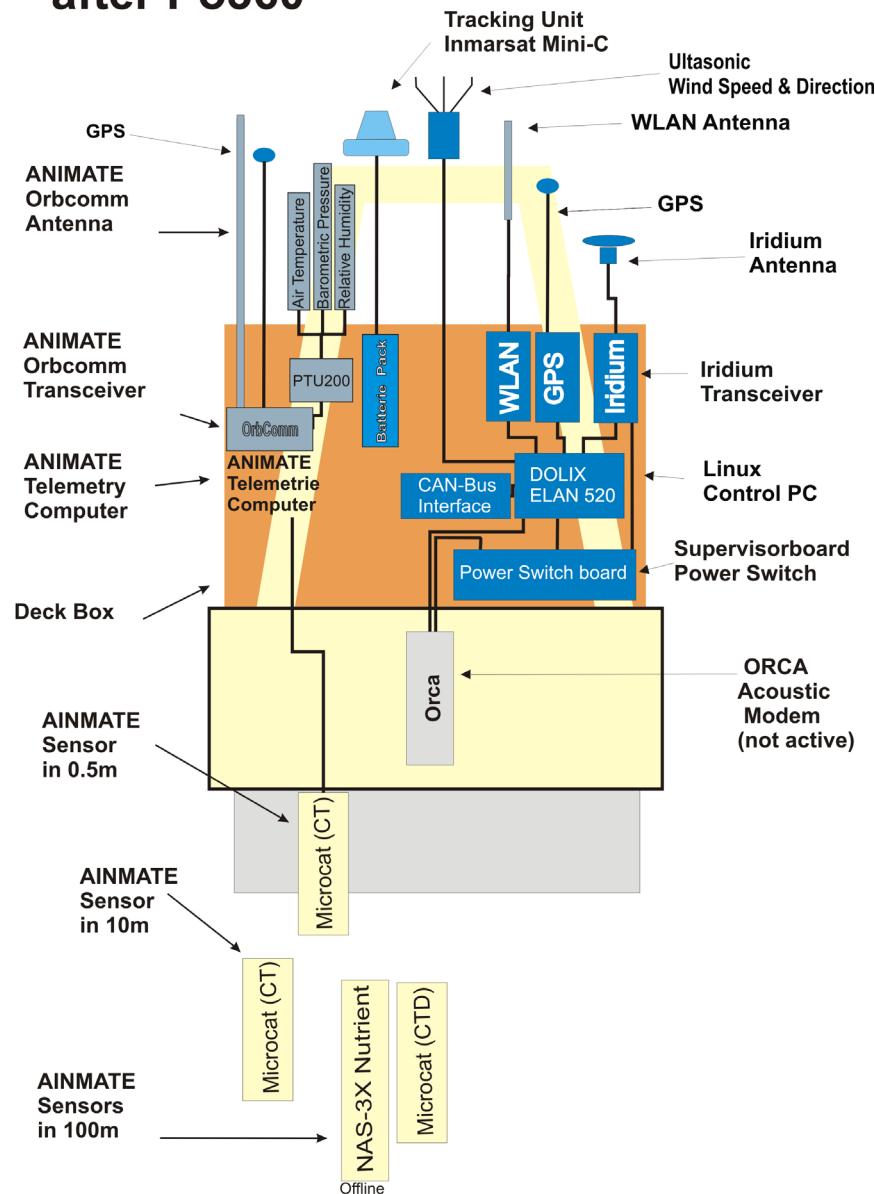

*Results of the tests before and after deployment*

All tested sensors and systems were working well during the tests prior to the deployment.

The tests after the deployment were successful as well. We performed a successful login on the DOLIX computer via Iridium from Bremen and restarted the system after a check.

DOLAN configuration November 2007

## Configuration of the DOLAN buoy after Po360

**Fig. 2: Configuration of the DOLAN SBU after cruise POS-360.**

The redeployment of the mooring took place at Nov. 5<sup>th</sup>, 2007.

Tests of all sensors on the DOLIX took place after the deployment of the DOLAN buoy.

All sensors like windspeed, Microcat DOLIX GPS were working fine.

These tests have been performed via the WLAN link on the buoy.

The test of the maximum range of the WLAN link shows that a very stable communication with a signal level of -74dBi was possible at a distance of 500m. Also the internal Laptop WLAN cards could be used for this distance. The maximum distance where a communication was not longer reliable was 1km with a signal level of -90dBi. A high rate of lost packets makes a telnet connection instable at this distance.

The tests shows that WLAN at a distance of 500m is a very useful and reliable Link for communication with the buoy. This distance was also accepted by the ships crew in terms of a safety distance.

*Status of the tasks from the MSM04-4b cruise*

- Redeployment of the upper mooring and the sensors  
Status: deployed
- Test of all sensors on the buoy  
Status: all tests were successful
- Test of the Orbcomm and Iridium Telemetry  
Status: All Satellite links are operational

*Tasks for the next cruise*

- Recovery of the whole DOLAN mooring / End of the project

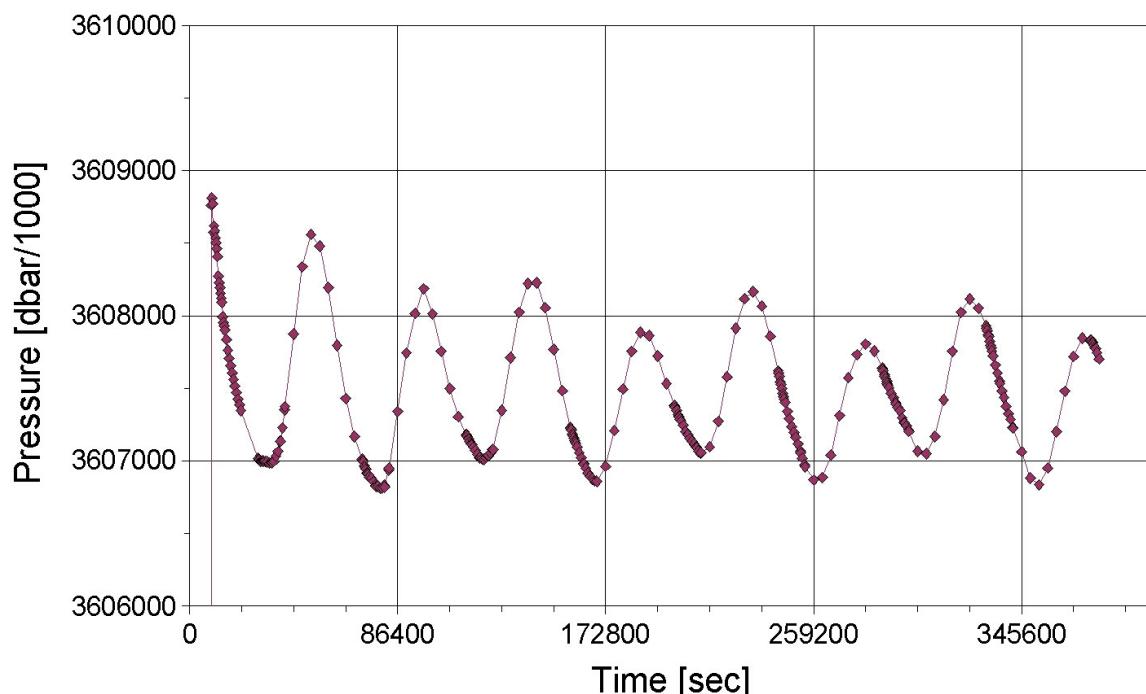

**4.2 PACT System trials**

During the cruise, two trials for testing PACT (Pressure acoustically coupled Tsunameter) units were conducted.

The first short trial focused on testing acoustic data transmission between bottom and surface unit and switching between different operating modes of the bottom unit. During this test, one subsurface mooring with the bottom PACT unit at around 3800m and the surface modem at approx. 500m depth was deployed.

The mooring was recovered after 5 days. Evaluation of logged data showed that reliable communication between bottom and surface unit was established. Altogether 393 messages with bottom pressure and status data were received from the surface unit - 2 messages were lost. In the diagram (Fig. 3), each point marks a transmitted message.

**PACT Short time test November 2007**

**Fig. 3: Pressure measurements against the time show the pressure cycles influenced by the tides.**

The second trial targeted the long term testing of those units. Again the bottom unit was deployed in a separated mooring at approx 1nm distance from the DOLAN surface buoy in 3330m waterdepth.

The HAM.Node receiver modem was mounted to the DOLAN buoy mooring in 12m depth and connected to an IRIDIUM satellite transceiver residing on top of the buoy. Data received from the PACT bottom unit is relayed to the AWI/Bremerhaven via the satellite link.

The satellite link also provides basic diagnostic functionality (like pinging the bottom unit, information about battery status ...)

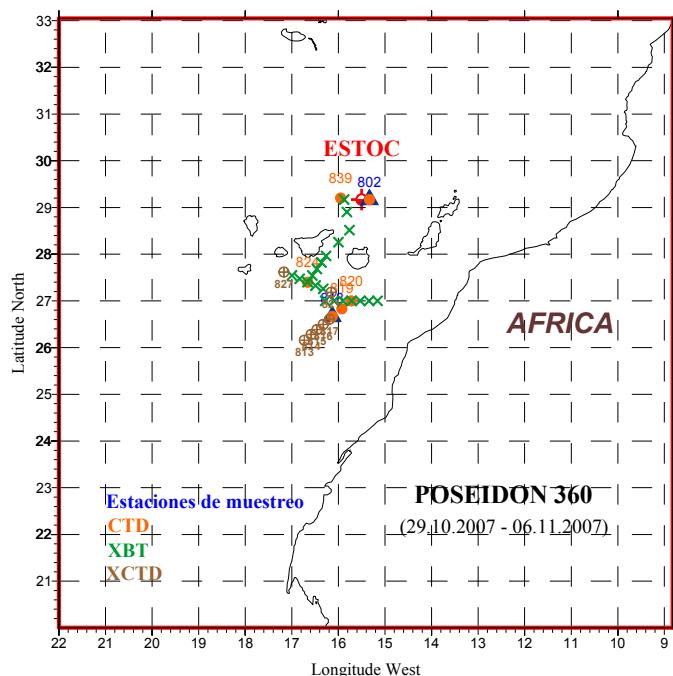

**Fig. 4: PACT modems in mooring frames and while deploying the test mooring.**

## 5. Marine Chemistry

### 5.1 Objectives and scientific questions

Along P360 the ANIMATE/ ESTOC mooring that stayed in the water was recovered and redeployed again complete according to the requirements of the MERSEA project of mooring exchange. It had been put in place in March 2007 during cruise MSM04/4, but in May part of the mooring broke and went adrift towards the southwest until it could be rescued and took it to the ICCM. Therefore some sensors were only in the water for two months, including the nitrate sensor #2400. The ICCM provide a complete refurbished nitrate sensor (#2625) to deploy it in the mooring during this cruise.

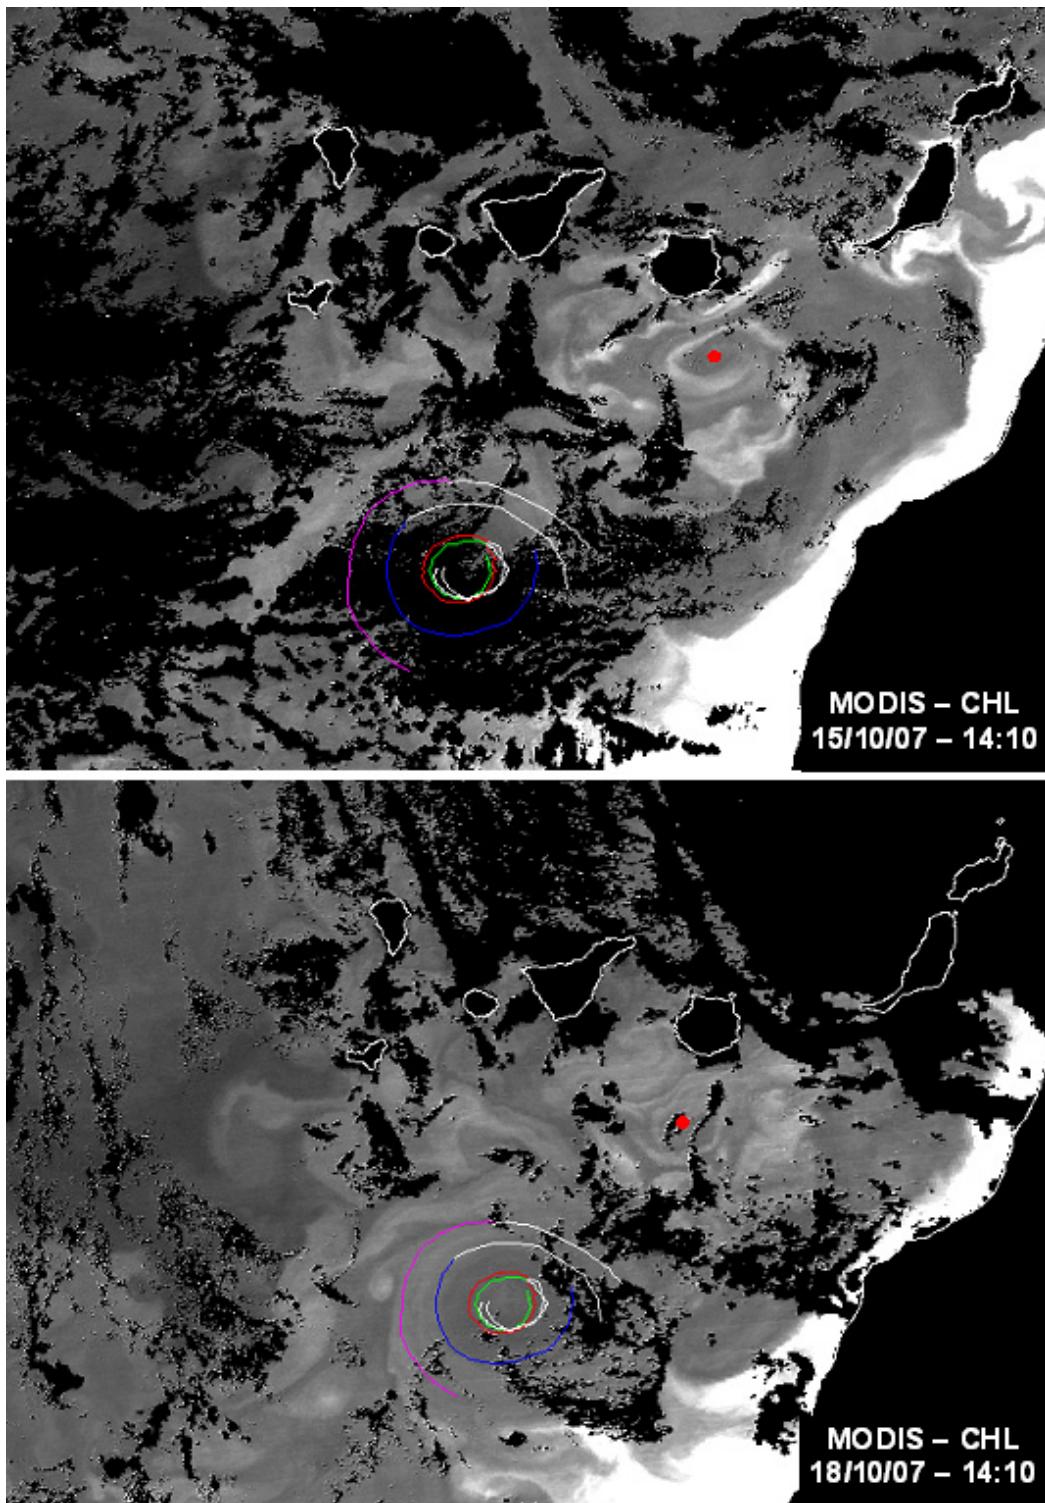

At the same time it was necessary to do the biogeochemical monthly samplings at the ESTOC station (European Station for Time series in the Ocean Canary islands), that it has been continuously done since 1994. A calibration casts with CTD and microcats was also made to accomplish the requirements of the sensors being deployed.

**Fig. 5: Position of the the different stations (CTD+ Rosette, CTD only, XBT and XCTD) made along Poseidon Pos-360.**

Along this cruise it was intended to work within some eddies usually located at the south of the Canary Islands, as part of a joint project between the Physics Dptm. of the University of Las Palmas and the ICCM. Previous to the cruise, several satellite images (MODIS, see Fig. 6) have shown some possible eddies that were adequate to sample in time and space along the cruise. It was intended to characterize their physical and chemical characteristics by means of the CTD/rosette and XBTs and XCTDs probes, depending on the time availability. However, the rosette failed after two stations (only ESTOC and station #818) because water entered into the electronic system;

hence, the eddies could only be physically characterized by means of the CTD mounted in the rosette which it was still working, and by XCTDs and XBTs otherwise (Fig. 5).

**Fig. 6:** MODIS images previous to the cruise taken 15<sup>th</sup> and 18<sup>th</sup> October 2007. Sea surface temperature is shown in the upper part and chlorophyll in the lower one. The colour lines show some drifters in an eddy. The red dot appears where it was intended to sample along the cruise because other eddy (cyclonic) was arriving to that site.

Further XBTs were deployed in the passage between Tenerife and Gran Canaria Islands, taking advantage of the ship going north to redeploy the mooring; the main objective was to track the

presence of the Antarctic Intermediate Water (AAIW). There is a great controversy whether the AAIW presence will seasonally change and to which extent in the north of the archipelago, due to the circulation through the passages between the different islands.

## 5.2. Data

At the beginning of the cruise the ESTOC station monthly sampling took place (st. 802, 2 profiles, sampled to the bottom), including the release of 4 NOAA drifters. Then the DOLAN/ MERSEA part of the mooring was recovered. Then at a latitude of 27°00'N, it was done a diameter transect of XBTs trying to identify the changes and looking for eddies. According to the last position given by the receiving images provided by the land team and further south, another station with two casts of CTD/rosette (#818, to 200m and 2000m) were sampled to start the eddy physical/chemical identification. Unfortunately, the rosette stop working and therefore, a transect with XCTDs was done to try to characterize the eddy at least from the physical point of view; this sampling ended by doing a CTD station and a NOAA drifter deployment.

**Table 2: List of stations sampled along the cruise P360, Las Palmas-Las Palmas (O=oxygen, N=nutrients, S=salinity, C=chlorophyll "a", Ca = Carbon system, Inc= Incidences) .**

01.11. 2007	819	3416	26°49.82' ,	15°55.52'	200			Rosette fails to close; it is taken on board, dismounted and found out it is full of water. End of Niskin sample, only CTD sample is possible							

Further, our land team found another eddy that we could possibly sampled, and therefore we were asked to try to go there and characterize it. Hence a second section of XBTs was done, ending with an XCTD. Finally, to take advantage of the way back to DOLAN to redeploy the mooring, another XBTs transect took place in the passage between Tenerife and Gran Canaria Islands until DOLAN, where a microcat calibration CTD was done. All the details of the CTD /rosette samplings are found in Tables 1 and 2.

As the rosette failed, other alternatives were found to try the characterisation of the eddies; as the number of XCTDs was not very high, the first strategy was to use them to make a diameter of the first eddy found; following instructions of the land team that was updating the satellite information, other eddy was sampled by means of XBTs. A total of 7 XCTDs and 20 XBTs were launched along the cruise, showing the detailed information in Table 3.

**Table 3: Stations sampled during cruise P360, rosette started to fail functioning at station #819.**

As part of the collaboration between the NOAA and the ICCM during the last 10 years at ESTOC, one NOAA buoys is launched at ESTOC included in the monthly sampling. However, during the last two years, and in order to statistically characterize the data obtained along the years, an exercise is taking place seasonally. In this case, the Autumn exercise was done by deploying 4 buoys at the same time, in order to analyse the variability of the data. Another buoy provided by the University of Las Palmas (64645) was deployed with the intention to put it in the core of one of the eddies, according to the latest satellite images data received on board (Table 4).

**Table 5. NOAA drifting buoys launched along P360.**

Identification Number	Date (dd/mm/yy)	Time GMT (hh:mm)	Latitude	Longitude
62326	30/10/07	02 :50	29° 10.96' N	015° 18.55' W
62327	30/10/07	02 :50	29° 10.96' N	015° 18.55' W
62328	30/10/07	02 :50	29° 10.96' N	015° 18.55' W
71092	30/10/07	02 :50	29° 10.96' N	015° 18.55' W
64645	02/11/07	19 :43	27° 23.85' N	016° 39.45' W

### 5.3 Methods

#### 5.3.1 Water Sampling

Samples were collected immediately after the Niskin bottles were on board from each depth. The sampling sequence was as follows:

- 1.) Oxygen: was taken in glass bottles of about 125 ml of volume which were previously cleaned and washed with HCl acid and was fixed at once; then it was kept for at least six hours according to WOCE regulations and finally it was analysed at the laboratory on board the ship.
- 2.) Carbon system measurements (only at ESTOC): in this case only alkalinity samples were taken in glass bottles and were fixed immediately on board.
- 3.) Nutrients: were taken in polypropylene bottles which were previously cleaned and washed with HCl acid and were completely dry. Samples were immediately frozen at -20°C, analysing them as soon as possible after arrival at the laboratory. Freezing the samples is a common practice; it does not or only in a non-significant way affect the nitrate+nitrite and the phosphate values (by a slight decrease) and is not noticeable in the silicate values (Kremling and Wenck, 1986; McDonald and McLunghlin, 1982).
- 4.) Salinity: samples were taken in dark glass bottles which were previously cleaned and washed with HCl acid. Then, they were kept in boxes to protect them from light till analysis on land.
- 5.) Chlorophyll: samples of one litre of water were taken. The chlorophyll samples were filtered immediately and the filters were frozen subsequently at -20°C. Their analyses takes place at the ICCM laboratory in land.

All samples were taken using the procedures established in the WOCE Operations Manual, WHP Office Report WHPO 91-1/WOCE Report No.68/91.

#### 5.3.2 Analysis

Dissolved Oxygen :The samples were analysed using the method described in the WOCE Operations Manual, WHP Office Report No. 68/91; the final titration point was detected using a Metrohm 665 Dosimat Oxygen Auto-Titrator Analyser.

#### *Carbonate system measurements*

The total alkalinity of seawater (AT) was determined by titration with HCl to the carbonic acid end point using two similar potentiometric systems, as described in more detail by Mintrop et al. (2000). In order to yield an ionic strength similar to open ocean seawater, the HCl solution (25 l, 0.25 M) was made from concentrated analytical grade HCl (Merck®, Darmstadt, Germany) in 0.45 M NaCl. The acid was standardised by titrating weighed amounts of Na<sub>2</sub>CO<sub>3</sub> dissolved in 0.7 M NaCl solutions. The total alkalinity of seawater was evaluated from the proton balance at the alkalinity equivalence point, pHequiv = 4.5, according to the exact definition of total alkalinity (Dickson, 1981). The performance of the titration systems was monitored by titrating different samples of certified reference material (CRM, batch 42) with known inorganic carbon and AT values. The agreement between our data and CRM values was within ±1.5 µmol kg<sup>-1</sup>. Total inorganic carbon (CT) is computed from experimental values of pH and total alkalinity, using the carbonic acid

dissociation constants of Mehrbach after Dickson and Millero (1987). This set of constants presented the best agreement between CT(pH, AT) calculations and certified CT values for CRM, batch 42, with a CT residual of  $\pm 3 \text{ } \mu\text{mol kg}^{-1}$ , n=54 (Millero, 1995, Lee et al., 1997).

### Nutrients

The nutrients determination was performed with a segmented continuous-flow autoanalyser, a Skalar® San Plus System (ICCM).

**Nitrate+Nitrite:** The automated procedure for the determination of nitrate and nitrite is based on the cadmium reduction method; the sample is passed through a column containing granulated copper-cadmium to reduce the nitrate to nitrite (Wood et al., 1967), using ammonium chloride as pH controller and complexer of the cadmium cations formed (Strickland and Parsons, 1972). The optimal column preparation conditions are described by several authors (Nydahl, 1976; Garside, 1993).

**Phosphate:** Orthophosphate concentration is understood as the concentration of reactive phosphate (Riley and Skirpov, 1975) and according to Koroleff (1983a) is a synonym of “dissolved inorganic phosphate”. The automated procedure for the determination of phosphate is based on the following reaction: ammonium molybdate and potassium antimony tartrate react in an acidic medium with diluted solution of phosphate to form an antimony-phospho-molybdate complex. This complex is reduced to an intensely blue-coloured complex, ascorbic acid. The complex is measured at 880nm. The basic methodology for this anion determination is given by Murphy and Riley (1962); the used methodology is the one adapted by Strickland and Parsons (1972).

**Silicate:** The determination of the soluble silicon compounds in natural waters is based on the formation of the yellow coloured silicomolybdic acid; the sample is acidified and mixed with an ammonium molybdate solution forming molybdsilicic acid. This acid is reduced with ascorbic acid to a blue dye, which is measured at 810nm. Oxalic acid is added to avoid phosphate interference. The used method is described in Koroleff (1983b).

**Phytoplankton pigments:** Pigments were measured using fluorimetric analysis, following the methodology described by Welschmeyer (1994). The determination was achieved using a fluorometer TURNER 10-AU-000.

**Salinity:** Samples were measured with a salinometer, model Autosal 8400a, whose measurement range was between 0.005-42 (psu), with an accuracy of  $\pm 0.003$ , according to the manufacturer. It was calibrated following the manufacturer's information and standardizing it with IAPSO Standard Seawater. Salinity values were calculated as practical salinity according to Unesco (1978, 1984).

## 5.4 Preliminary Results

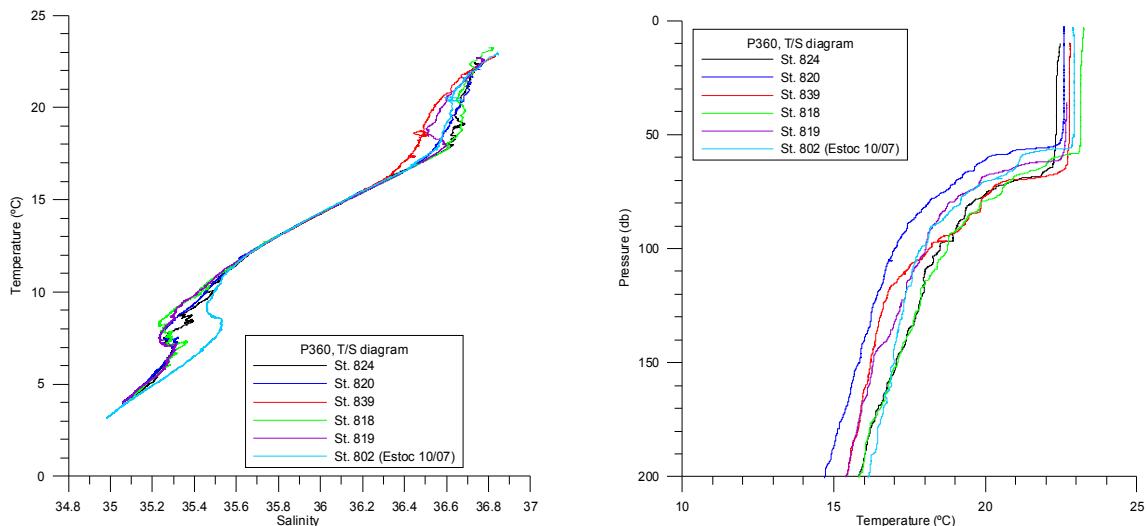

As already mentioned previously in the data description, during this cruise only two stations could be sampled chemically because the rosette failed by having water inside; therefore, data for oxygen, nutrients, chlorophyll and salinity are restricted to the two stations. However, some other stations could be sampled physically, hence some T/S diagrams could be presented and discussed.

By observing the T/S diagrams, and as usual for this area in the Fall for surface waters, the seasonal thermocline that appears in the Summer starts its breakage, producing the appearance of the mixed

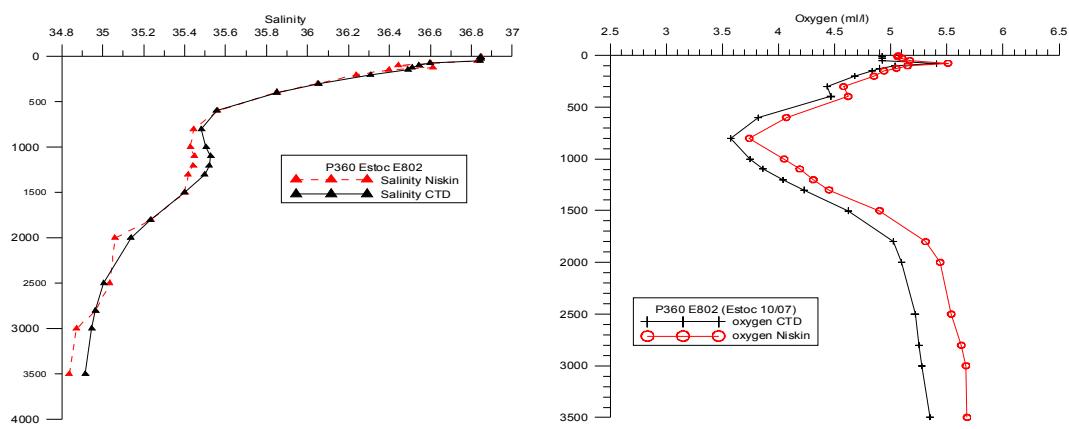

layer. During this cruise, and according to the CTD results, the mixed layer is found at depths ranging from 60 to 90 db for all the stations sampled (Fig. 7, right), starting before the southern the stations are located.

At depths below the surface layer, the temperature/ salinity plots obtained from the CTD's made along P360 (Figure 3, left), a linear transect shows that the North Atlantic Water (NACW) is always present. Values of temperature range between 12°C and 16°C, whereas salinity range is 35.6 - 36.4.

The intermediate water masses usually encountered in this area (800-1200 m) are the Antarctic Intermediate Water (AAIW) both at the north and south, and the Mediterranean Water (MW) to the north (warmer and more saline). The amount of these water masses at those depths produces a range of temperature and salinities of 5-12°C and 35.15-35.55 respectively. As an example in Fig. 7 (left), the T/S corresponding to ESTOC shows at these depths warmer and with more salinity waters than the other stations, reflecting a greater influence of the MW; according to Llinas et al. (2003), the detection limit of the MW is a salinity value of 35.5.

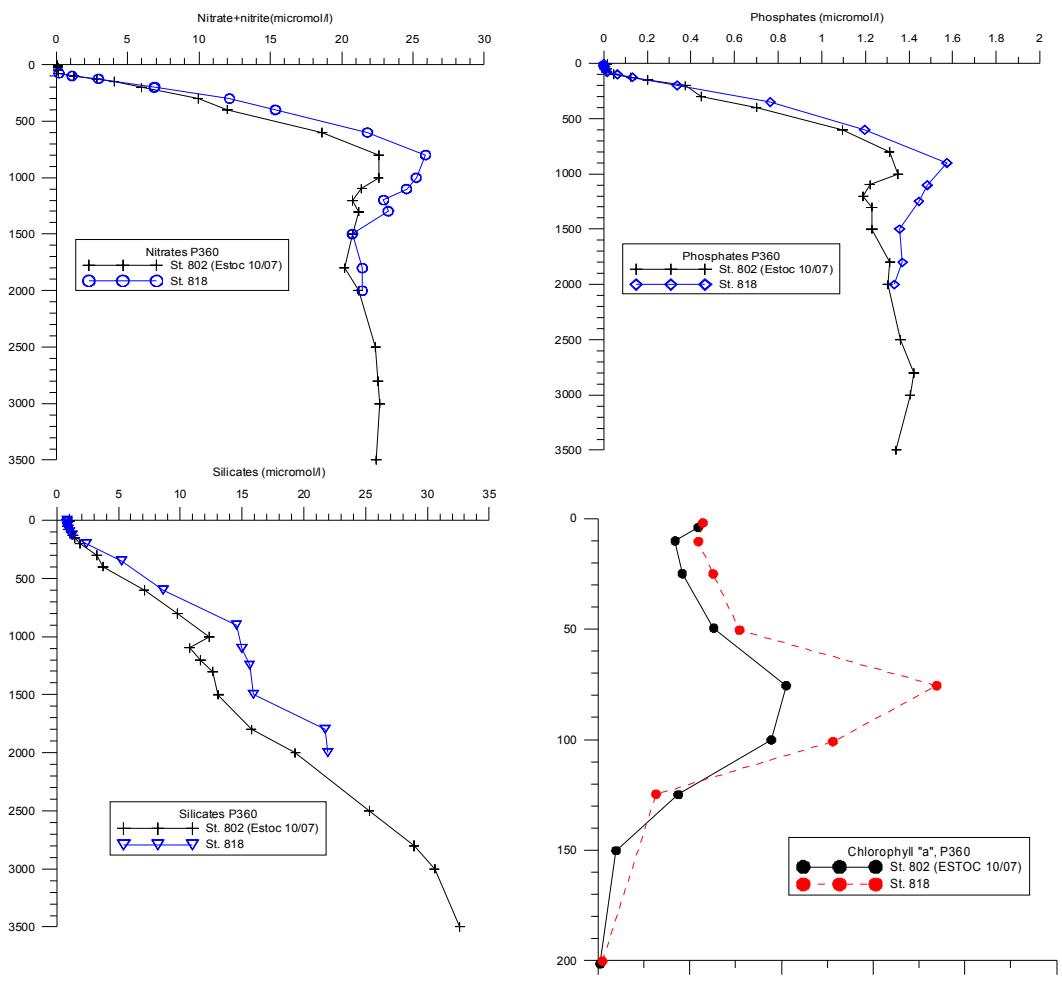

**Fig. 7: Left:** Diagrams T/S (3500m nominal depth) of the stations sampled with CTD along P360, including station ESTOC (st. 802). **To the right:** Potential temperature versus pressure for the surface waters for the same stations (colours correspond).

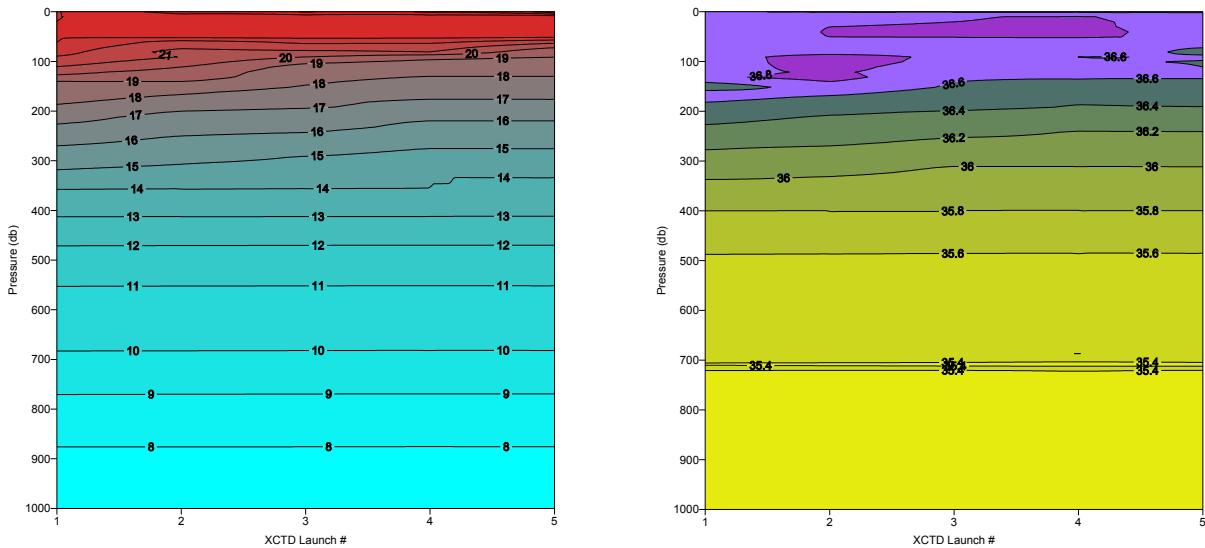

**Figure 4.** Left: Salinity from the ESTOC site, comparing values obtained from sampling the Niskin bottles (black) and those measured by the CTD for the same site (red). To the right: the same comparison with the oxygen values.

Salinity values taken at ESTOC were compared with those of the CTD, stating the fact that certain important intermediate areas are not well obtained for salinity by the CTD (Figure 4, left). The same occurs with the oxygen data, where the values taken by the CTD are always lower than those measured on board, showing greater differences as going deeper.

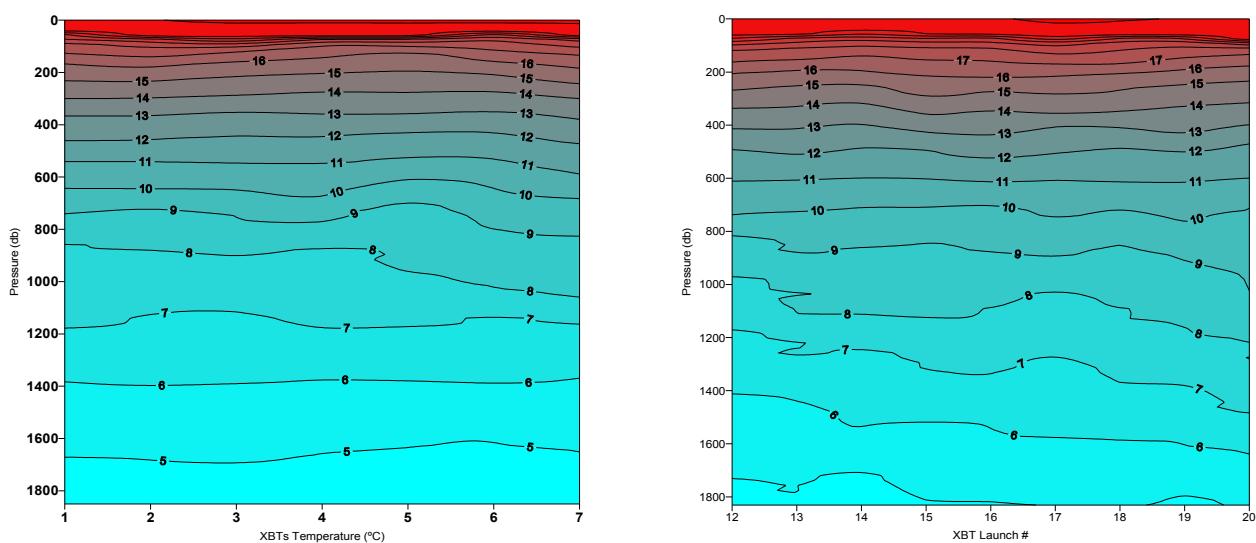

**Figure 5.** Values of nutrients (nitrate, phosphate and silicate) and chlorophyll „a“ (only to 200db, down right) versus pressure for the two stations where sampling of the Niskin bottles was possible.

The values of nutrients and chlorophyll „a“ (Figure 5) seem adequate for the ESTOC station for this season according to the data obtained during a decade; the more southern station 818 has greater values mainly at intermediate depths due to the longitudinal variation and appearance of water masses; it is remarkable to find out the chlrophyll „a“ maximum at the south, which presents twice the value of the northern station (0.4 µg/l).

**Figure 6. Temperature and salinity of XCTDs from the section going from st. 813 or XCTD #1 (southwest) to st. 817 our XCTD #5 (northeast).**

Figure 6 shows the section of XCTD's temperature and salinity, including the bulking of isotherms due to the presence of a cyclonic eddy, as shown before the cruise. Values of salinity increase too in the same area. Further detailed surface studies are being done to better characterize the intensity of the eddy. Two of the transects of XBTs are presented in Figure 7, to the left along latitude 27°N from west to east, where it is possible to distinguish the water masses variations at intermediate depth and the surface isotherms closeness indicating bulking and depressions of the subsurface waters, characteristic of the eddies.

**Figure 7. Left: Temperature of XBTs section from shoot #1 (west) to #7 (east); Right: the same but for the northern section, going from XBT #12 (south) to #20 (north).**

To the right in Figure 7 it is depicted the section going through the channel between Tenerife and Gran Canaria Islands, starting southwest of Tenerife Island and ending at DOLAN. At intermediate depths, we have found that the stations out of the channel to the south show greater variability, probably affected by the influence of the channel between La Gomera and Tenerife Islands. Within the channel, we find the customary bulky process induced by the channelling of the water masses entering it, ending up with a deepening of the isotherms to the north out of the channel. On the surface waters, no significant influences or features are found.

## **8. Acknowledgements**

All scientific cruise participants thank Captain Michael Schneider and his entire crew for the flexible and friendly assistance during the R/V POSEIDON cruise 360. As on the previous cruises it was a good example of professional support and handling.

The teamwork among the crew and scientists was friendly and relaxed as known from several other cruises on R/V POSEIDON. The cruise could be realized successfully.

Late Quaternary biogenic opal sedimentation in diatom assemblages in Kongo Fan sediments. 96 pages, Bremen, 2002.
- No. 189 Esper, O.**  
Reconstruction of Recent and Late Quaternary oceanographic conditions in the eastern South Atlantic Ocean based on calcareous- and organic-walled dinoflagellate cysts. 130 pages, Bremen, 2001.
- No. 190 Wendler, I.**  
Production and preservation of calcareous dinoflagellate cysts in the modern Arabian Sea. 117 pages, Bremen, 2002.
- No. 191 Bauer, J.**  
Late Cenomanian – Santonian carbonate platform evolution of Sinai (Egypt): stratigraphy, facies, and sequence architecture. 178 pages, Bremen, 2002.
- No. 192 Hildebrand-Habel, T.**  
Die Entwicklung kalkiger Dinoflagellaten im Südatlantik seit der höheren Oberkreide. 152 pages, Bremen, 2002.
- No. 193 Hecht, H.**  
Sauerstoff-Optopoden zur Quantifizierung von Pyritverwitterungsprozessen im Labor- und Langzeit-in-situ-Einsatz. Entwicklung - Anwendung – Modellierung. 130 pages, Bremen, 2002.

- No. 194 Fischer, G. and cruise participants**  
Report and Preliminary Results of RV METEOR-Cruise M49/4, Salvador da Bahia – Halifax, 4.4.-5.5.2001. 84 pages, Bremen, 2002.
- No. 195 Gröger, M.**  
Deep-water circulation in the western equatorial Atlantic: inferences from carbonate preservation studies and silt grain-size analysis. 95 pages, Bremen, 2002.
- No. 196 Meinecke, G. and cruise participants**  
Report of RV POSEIDON Cruise POS 271, Las Palmas - Las Palmas, 19.3.-29.3.2001. 19 pages, Bremen, 2002.
- No. 197 Meggers, H. and cruise participants**  
Report of RV POSEIDON Cruise POS 272, Las Palmas - Las Palmas, 1.4.-14.4.2001. 19 pages, Bremen, 2002.
- No. 198 Gräfe, K.-U.**  
Stratigraphische Korrelation und Steuerungsfaktoren Sedimentärer Zyklen in ausgewählten Borealen und Tethyalen Becken des Cenoman/Turon (Oberkreide) Europas und Nordwestafrikas. 197 pages, Bremen, 2002.
- No. 199 Jahn, B.**  
Mid to Late Pleistocene Variations of Marine Productivity in and Terrigenous Input to the Southeast Atlantic. 97 pages, Bremen, 2002.
- No. 200 Al-Rousan, S.**  
Ocean and climate history recorded in stable isotopes of coral and foraminifers from the northern Gulf of Aqaba. 116 pages, Bremen, 2002.
- No. 201 Azouzi, B.**  
Regionalisierung hydraulischer und hydrogeochemischer Daten mit geostatistischen Methoden. 108 pages, Bremen, 2002.
- No. 202 Spieß, V. and cruise participants**  
Report and preliminary results of METEOR Cruise M 47/3, Libreville (Gabun) - Walvis Bay (Namibia), 01.06 - 03.07.2000. 70 pages, Bremen 2002.
- No. 203 Spieß, V. and cruise participants**  
Report and preliminary results of METEOR Cruise M 49/2, Montevideo (Uruguay) - Montevideo, 13.02 - 07.03.2001. 84 pages, Bremen 2002.
- No. 204 Mollenhauer, G.**  
Organic carbon accumulation in the South Atlantic Ocean: Sedimentary processes and glacial/interglacial Budgets. 139 pages, Bremen 2002.
- No. 205 Spieß, V. and cruise participants**  
Report and preliminary results of METEOR Cruise M49/1, Cape Town (South Africa) - Montevideo (Uruguay), 04.01.2001 - 10.02.2001. 57 pages, Bremen, 2003.
- No. 206 Meier, K.J.S.**  
Calcareous dinoflagellates from the Mediterranean Sea: taxonomy, ecology and palaeoenvironmental application. 126 pages, Bremen, 2003.
- No. 207 Rakic, S.**  
Untersuchungen zur Polymorphie und Kristallchemie von Silikaten der Zusammensetzung  $\text{Me}_2\text{Si}_2\text{O}_5$  ( $\text{Me}:\text{Na}, \text{K}$ ). 139 pages, Bremen, 2003.
- No. 208 Pfeifer, K.**  
Auswirkungen frühdiagenetischer Prozesse auf Calcit- und Barytgehalte in marinen Oberflächensedimenten. 110 pages, Bremen, 2003.
- No. 209 Heuer, V.**  
Spurenelemente in Sedimenten des Südatlantik. Primärer Eintrag und frühdiagenetische Überprägung. 136 pages, Bremen, 2003.
- No. 210 Streng, M.**  
Phylogenetic Aspects and Taxonomy of Calcareous Dinoflagellates. 157 pages, Bremen 2003.
- No. 211 Boeckel, B.**  
Present and past coccolith assemblages in the South Atlantic: implications for species ecology, carbonate contribution and palaeoceanographic applicability. 157 pages, Bremen, 2003.
- No. 212 Precht, E.**  
Advectional interfacial exchange in permeable sediments driven by surface gravity waves and its ecological consequences. 131 pages, Bremen, 2003.
- No. 213 Frenz, M.**  
Grain-size composition of Quaternary South Atlantic sediments and its paleoceanographic significance. 123 pages, Bremen, 2003.

- No. 214 Meggers, H. and cruise participants**  
Report and preliminary results of METEOR Cruise M 53/1, Limassol - Las Palmas – Mindelo, 30.03.2002 - 03.05.2002. 81 pages, Bremen, 2003.
- No. 215 Schulz, H.D. and cruise participants**  
Report and preliminary results of METEOR Cruise M 58/1, Dakar – Las Palmas, 15.04..2003 – 12.05.2003. Bremen, 2003.
- No. 216 Schneider, R. and cruise participants**  
Report and preliminary results of METEOR Cruise M 57/1, Cape Town – Walvis Bay, 20.01. – 08.02.2003. 123 pages, Bremen, 2003.
- No. 217 Kallmeyer, J.**  
Sulfate reduction in the deep Biosphere. 157 pages, Bremen, 2003.
- No. 218 Røy, H.**  
Dynamic Structure and Function of the Diffusive Boundary Layer at the Seafloor. 149 pages, Bremen, 2003.
- No. 219 Pätzold, J., C. Hübscher and cruise participants**  
Report and preliminary results of METEOR Cruise M 52/2&3, Istanbul – Limassol – Limassol, 04.02. – 27.03.2002. Bremen, 2003.
- No. 220 Zabel, M. and cruise participants**  
Report and preliminary results of METEOR Cruise M 57/2, Walvis Bay – Walvis Bay, 11.02. – 12.03.2003. 136 pages, Bremen 2003.
- No. 221 Salem, M.**  
Geophysical investigations of submarine prolongations of alluvial fans on the western side of the Gulf of Aqaba-Red Sea. 100 pages, Bremen, 2003.
- No. 222 Tilch, E.**  
Oszillation von Wattflächen und deren fossiles Erhaltungspotential (Spiekerooger Rückseitenwatt, südliche Nordsee). 137 pages, Bremen, 2003.
- No. 223 Frisch, U. and F. Kockel**  
Der Bremen-Knoten im Strukturnetz Nordwest-Deutschlands. Stratigraphie, Paläogeographie, Strukturgeologie. 379 pages, Bremen, 2004.
- No. 224 Kolonic, S.**  
Mechanisms and biogeochemical implications of Cenomanian/Turonian black shale formation in North Africa: An integrated geochemical, millennial-scale study from the Tarfaya-LaAyoune Basin in SW Morocco. 174 pages, Bremen, 2004. Report online available only.
- No. 225 Panteleit, B.**  
Geochemische Prozesse in der Salz- Süßwasser Übergangszone. 106 pages, Bremen, 2004.
- No. 226 Seiter, K.**  
Regionalisierung und Quantifizierung benthischer Mineralisationsprozesse. 135 pages, Bremen, 2004.
- No. 227 Bleil, U. and cruise participants**  
Report and preliminary results of METEOR Cruise M 58/2, Las Palmas – Las Palmas (Canary Islands, Spain), 15.05. – 08.06.2003. 123 pages, Bremen, 2004.
- No. 228 Kopf, A. and cruise participants**  
Report and preliminary results of SONNE Cruise SO175, Miami - Bremerhaven, 12.11 - 30.12.2003. 218 pages, Bremen, 2004.
- No. 229 Fabian, M.**  
Near Surface Tilt and Pore Pressure Changes Induced by Pumping in Multi-Layered Poroelastic Half-Spaces. 121 pages, Bremen, 2004.
- No. 230 Segl, M. , and cruise participants**  
Report and preliminary results of POSEIDON cruise 304 Galway – Lisbon, 5. – 22. Oct. 2004. 27 pages, Bremen 2004
- No. 231 Meinecke, G. and cruise participants**  
Report and preliminary results of POSEIDON Cruise 296, Las Palmas – Las Palmas, 04.04 – 14.04.2003. 42 pages, Bremen 2005.
- No. 232 Meinecke, G. and cruise participants**  
Report and preliminary results of POSEIDON Cruise 310, Las Palmas – Las Palmas, 12.04 – 26.04.2004. 49 pages, Bremen 2005.
- No. 233 Meinecke, G. and cruise participants**  
Report and preliminary results of METEOR Cruise 58/3, Las Palmas - Ponta Delgada, 11.06 - 24.06.2003. 50 pages, Bremen 2005.

- No. 234** **Feseker, T.**  
Numerical Studies on Groundwater Flow in Coastal Aquifers. 219 pages. Bremen 2004.
- No. 235** **Sahling, H. and cruise participants**  
Report and preliminary results of R/V POSEIDON Cruise P317/4, Istanbul-Istanbul , 16 October - 4 November 2004. 92 pages, Bremen 2004.
- No. 236** **Meinecke, G. und Fahrerteilnehmer**  
Report and preliminary results of POSEIDON Cruise 305, Las Palmas (Spain) - Lisbon (Portugal), October 28th – November 6th, 2004. 43 pages, Bremen 2005.
- No. 237** **Ruhland, G. and cruise participants**  
Report and preliminary results of POSEIDON Cruise 319, Las Palmas (Spain) - Las Palmas (Spain), December 6th – December 17th, 2004. 50 pages, Bremen 2005.
- No. 238** **Chang, T.S.**  
Dynamics of fine-grained sediments and stratigraphic evolution of a back-barrier tidal basin of the German Wadden Sea (southern North Sea). 102 pages, Bremen 2005.
- No. 239** **Lager, T.**  
Predicting the source strength of recycling materials within the scope of a seepage water prognosis by means of standardized laboratory methods. 141 pages, Bremen 2005.
- No. 240** **Meinecke, G.**  
DOLAN - Operationelle Datenübertragung im Ozean und Laterales Akustisches Netzwerk in der Tiefsee. Abschlußbericht. 42 pages, Bremen 2005.
- No. 241** **Guasti, E.**  
Early Paleogene environmental turnover in the southern Tethys as recorded by foraminiferal and organic-walled dinoflagellate cysts assemblages. 203 pages, Bremen 2005.
- No. 242** **Riedinger, N.**  
Preservation and diagenetic overprint of geochemical and geophysical signals in ocean margin sediments related to depositional dynamics. 91 pages, Bremen 2005.
- No. 243** **Ruhland, G. and cruise participants**  
Report and preliminary results of POSEIDON cruise 320, Las Palmas (Spain) - Las Palmas (Spain), March 08th - March 18th, 2005. 57 pages, Bremen 2005.
- No. 244** **Inthorn, M.**  
Lateral particle transport in nepheloid layers – a key factor for organic matter distribution and quality in the Benguela high-productivity area. 127 pages, Bremen, 2006.
- No. 245** **Aspetsberger, F.**  
Benthic carbon turnover in continental slope and deep sea sediments: importance of organic matter quality at different time scales. 136 pages, Bremen, 2006.
- No. 246** **Hebbeln, D. and cruise participants**  
Report and preliminary results of RV SONNE Cruise SO-184, PABESIA, Durban (South Africa) – Cilacap (Indonesia) – Darwin (Australia), July 08th - September 13th, 2005. 142 pages, Bremen 2006.
- No. 247** **Ratmeyer, V. and cruise participants**  
Report and preliminary results of RV METEOR Cruise M61/3. Development of Carbonate Mounds on the Celtic Continental Margin, Northeast Atlantic. Cork (Ireland) – Ponta Delgada (Portugal), 04.06. – 21.06.2004. 64 pages, Bremen 2006.
- No. 248** **Wien, K.**  
Element Stratigraphy and Age Models for Pelagites and Gravity Mass Flow Deposits based on Shipboard XRF Analysis. 100 pages, Bremen 2006.
- No. 249** **Krastel, S. and cruise participants**  
Report and preliminary results of RV METEOR Cruise M65/2, Dakar - Las Palmas, 04.07. – 26.07.2005. 185 pages, Bremen 2006.
