## **Cruise objectives**

During the scientific cruise Pos 287, titled PALEO I, the Departamento de Geologia Marinha (DGM) of the Instituto Geológico e Mineiro (IGM) collected sediment samples along the western Portuguese shelf and continental margin with the German research vessel "FS Poseidon". The cruise was supported by the INGMAR project "Paleoceanography and Environment", funded by the Fundação para a Ciência e a Tecnologia, and took place between April 22 and May 3, 2002.

The environmental part of the cruise focuses on the shelf areas of the Ave-Douro, the Lis, the Tejo, and the Mira river mouths. The study intends to reconstruct the concentrations of heavy metals and organic pollutants in the shelf sediments and to, thereby, differentiate between their natural (geogenic) and anthropogenic input during the last 200 years. In the Mira area, a few cores will also be used to study authigenic minerals like glauconite. The paleoceanographic part encompasses coring in the Tejo estuary and fan and along four transects across the continental margin between 39 and 41.5°N. The core transects will be used to monitor temporal and spatial variations in the upwelling-related productivity off Portugal and to reconstruct changes in the surface and deep waters, especially the Mediterranean Outflow (MOW), during the last glacial –interglacial cycle (i.e. the last 110 000 years).

## **Environment**

The major aim of the environmental studies is to differentiate between geogenic and anthropogenic inputs of heavy metal and organic pollutants (like PCB) to the sediments of the Portuguese shelf with a special focus on the changes during the last 200 years, i.e. since the onset of the industrial revolution. As their distribution is controlled by various factors including the geology of the river's hinterland and the sediment components carrying them, areas with different controlling factors need to be sampled and a data base for the "natural" variability of the metals and pollutants, equal to a geochemical background, needs to be established. The four shelf areas off the Ave and Douro rivers, the Lis, Tejo, and Mira river, respectively, were chosen based on their morphology, the differences in the river's catchment geology, the various types of industry and agriculture, and the population size along the river. The morphology plays an important role in the type and amount of sediment caught on the shelf, whereas the rocks cropping out in the river's hinterland greatly influence the types of heavy metals to be found. The geochemical background will be based on the metals' spatial and temporal distribution during the late Holocene, approximately the last 6000 years, i.e. way before major anthropogenic influences. This will be accomplished by studying numerous box core sequences and one gravity core in each area. Another research aspect intends to identify and characterise the types of sediment components that carry the heavy metals and organic pollutants to the shelves and fix them to the sediment thereby controlling their distribution on the shelves and their mobility in the water.

The Mira area is also known as a major accumulation area of authigenic minerals, especially glauconite, on the Portuguese margin. Several box cores were taken on the upper slope, which will allow to study the evolutionary stages of these minerals and to evaluate, if they are formed locally or just accumulated.

## **Paleoceanography**

The paleoceanographic studies mainly focus on four transects of 6-12 m long gravity cores (with accompanying box and multi-cores), which were retrieved across the continental margin

between 39 and 41.5 °N and cover water depths of 400 to 3000 m. They will supplement already existing transects in the south (ENAM cruise) and cores retrieved during the two IMAGES along the Portuguese margin in 1995 and 2001. The new sites will be used for multi proxy studies of the temporal and spatial variability in the upwelling related productivity off Portugal during the last 110 000 years and changes in the hydrography, with a special focus on the surface water currents and the variations in the strength and volume of the Mediterranean Outflow (MOW). On the base of the last aspect the coring sites were positioned above the current depth interval of the MOW, within (1-2 cores) and below it. The surface sediments of the paleoceanographic transect and environmental study areas will furthermore increase the database for the assemblage distributions of diatoms, planktonic and benthic foraminifera. The diatom and planktonic foraminifera assemblage data build the modern analog database for the global and local transfer functions used to calculate paleo-surface water temperatures and – productivities.

### **Holsmeer project**

The coring sites in the Tejo river and in the Tejo fan will be used to reconstruct variations of the Tejo's discharge volume in relation to climatic changes in the Portuguese hinterland. The cores will complement the cores studied by DGM students within the European funded HOLSMEER project, which focuses on the climate of the last 2000 years.

### **Personal**

#### *Participants from DGM-IGM:*

José H. Monteiro (chief scientist)  
Antonio Ferreira (co-chief scientist environment)  
Antje Voelker (co-chief scientist paleoceanography)  
Pedro Freitas  
Vitor Magalhaes  
Mario Mil-Homens  
Susana Muinos  
Silvia Nave  
Emilia Salgueiro  
Sandra Vaqueiro

#### *Other participants:*

Teresa Drago (IPIMAR, Lisboa, Portugal)  
Klaus Ricklefs (Forschungs- und Technologiezentrum Westküste, Büsum, Germany)  
Gerd Schriever (OKTOPUS GmbH, Hohenwestedt, Germany) (only 22<sup>nd</sup> – 23<sup>rd</sup> April)  
Robert Wilson (Scripps Institution of Oceanography, San Diego, USA) (only 22<sup>nd</sup> – 23<sup>rd</sup> April)

### ***Equipment employed during the cruise***

3.5 kHz system for seismic surveys  
Box corer (50 x 50 cm)  
Multicorer  
6 or 12 m long gravity corer  
1 m Kastenlot corer (17 x 17 cm)

## *Chronology*

### **22-4-2002**

11:10H – Sailing from Cais Marítimo de Alcântara.  
11:42H – Station PO287-001 on the Tagus Estuary to test the Box-corer, the multi corer and the kastenlot (8 operations).  
15:15H – Transit to profile AP1 in the Esporão da Estremadura.
