

Measuring dissolved gases (CO_2 and CH_4) with the HydroC™ in flow-through applications and on other platforms – Past measurements and future advancements

Peer Fietzek

CONTROS Systems & Solutions GmbH,

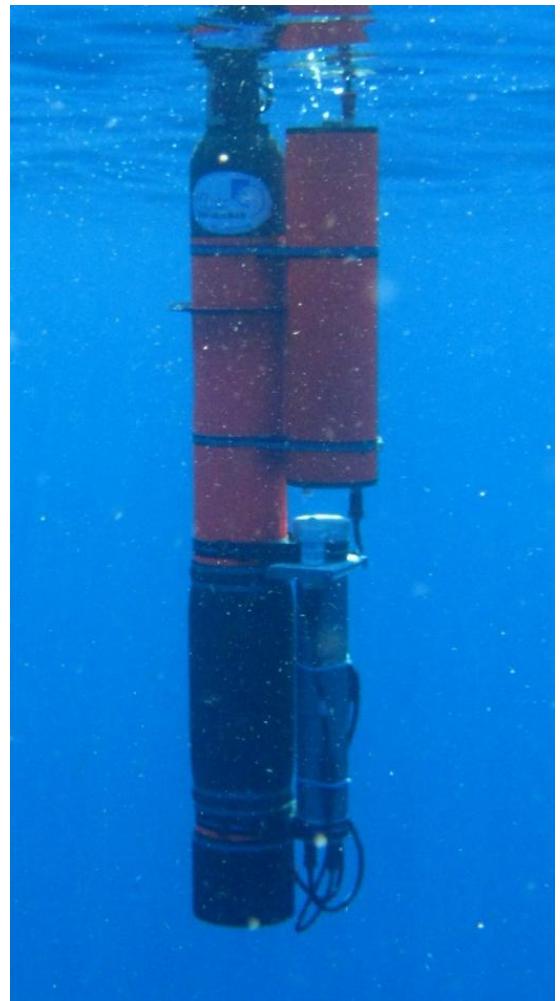

IFM-GEOMAR

Geesthacht, 1.9.2011

Outline

- Motivation & Fields of Application
- Connection between platforms and sensors:
Platforms & Sensor integration
- Sensor design & Measuring principle
- Calibration
- Example data
- Summary & Outlook

Measuring Principle - HydroC™

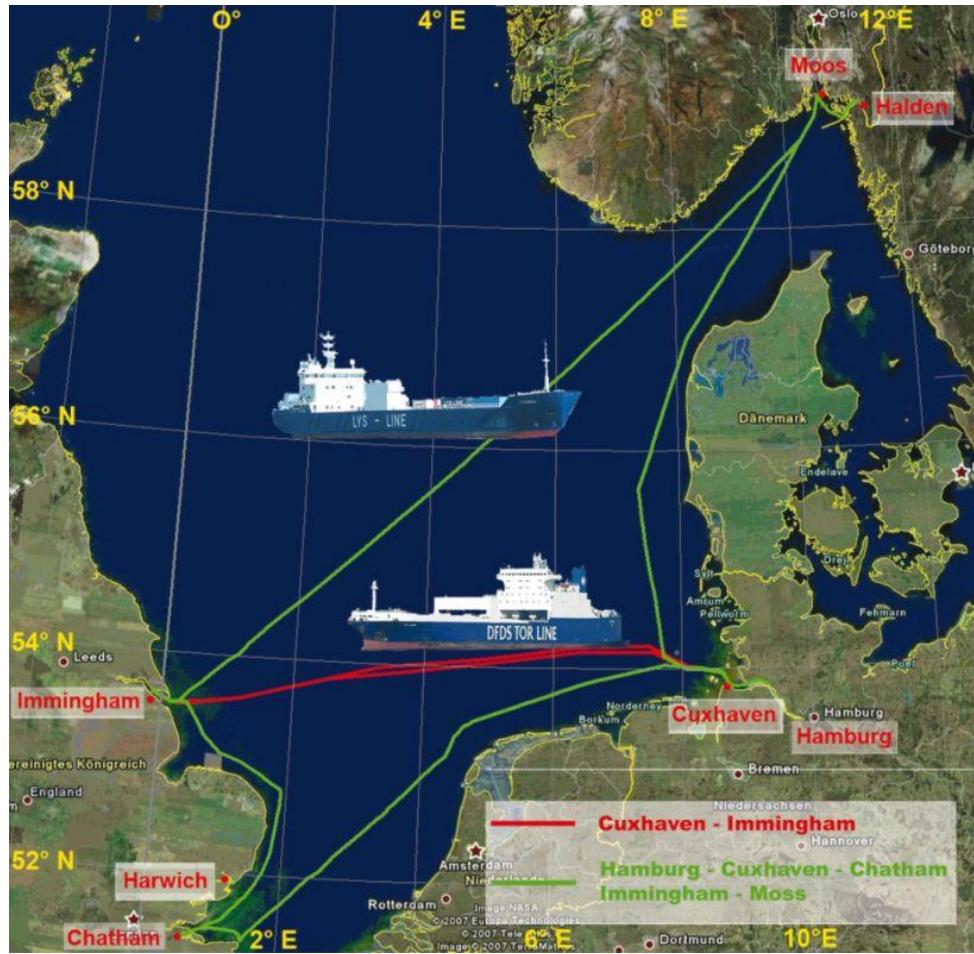

1. Dissolved gasses and water vapor pass hydrophobic membrane
→ Equilibration
2. Gas concentration measured by non-dispersive infrared spectrometry (NDIR) within a gas circuit; Zeroing included (for CO₂)
3. Internal datalogger saves xCO₂ along with T , p and rH (microcontroller and AD-converter); RS 232 – serial connection

Example data – ACT-Test Seattle

HZG-FB – Tor Dania – Cuxhaven-Immingham

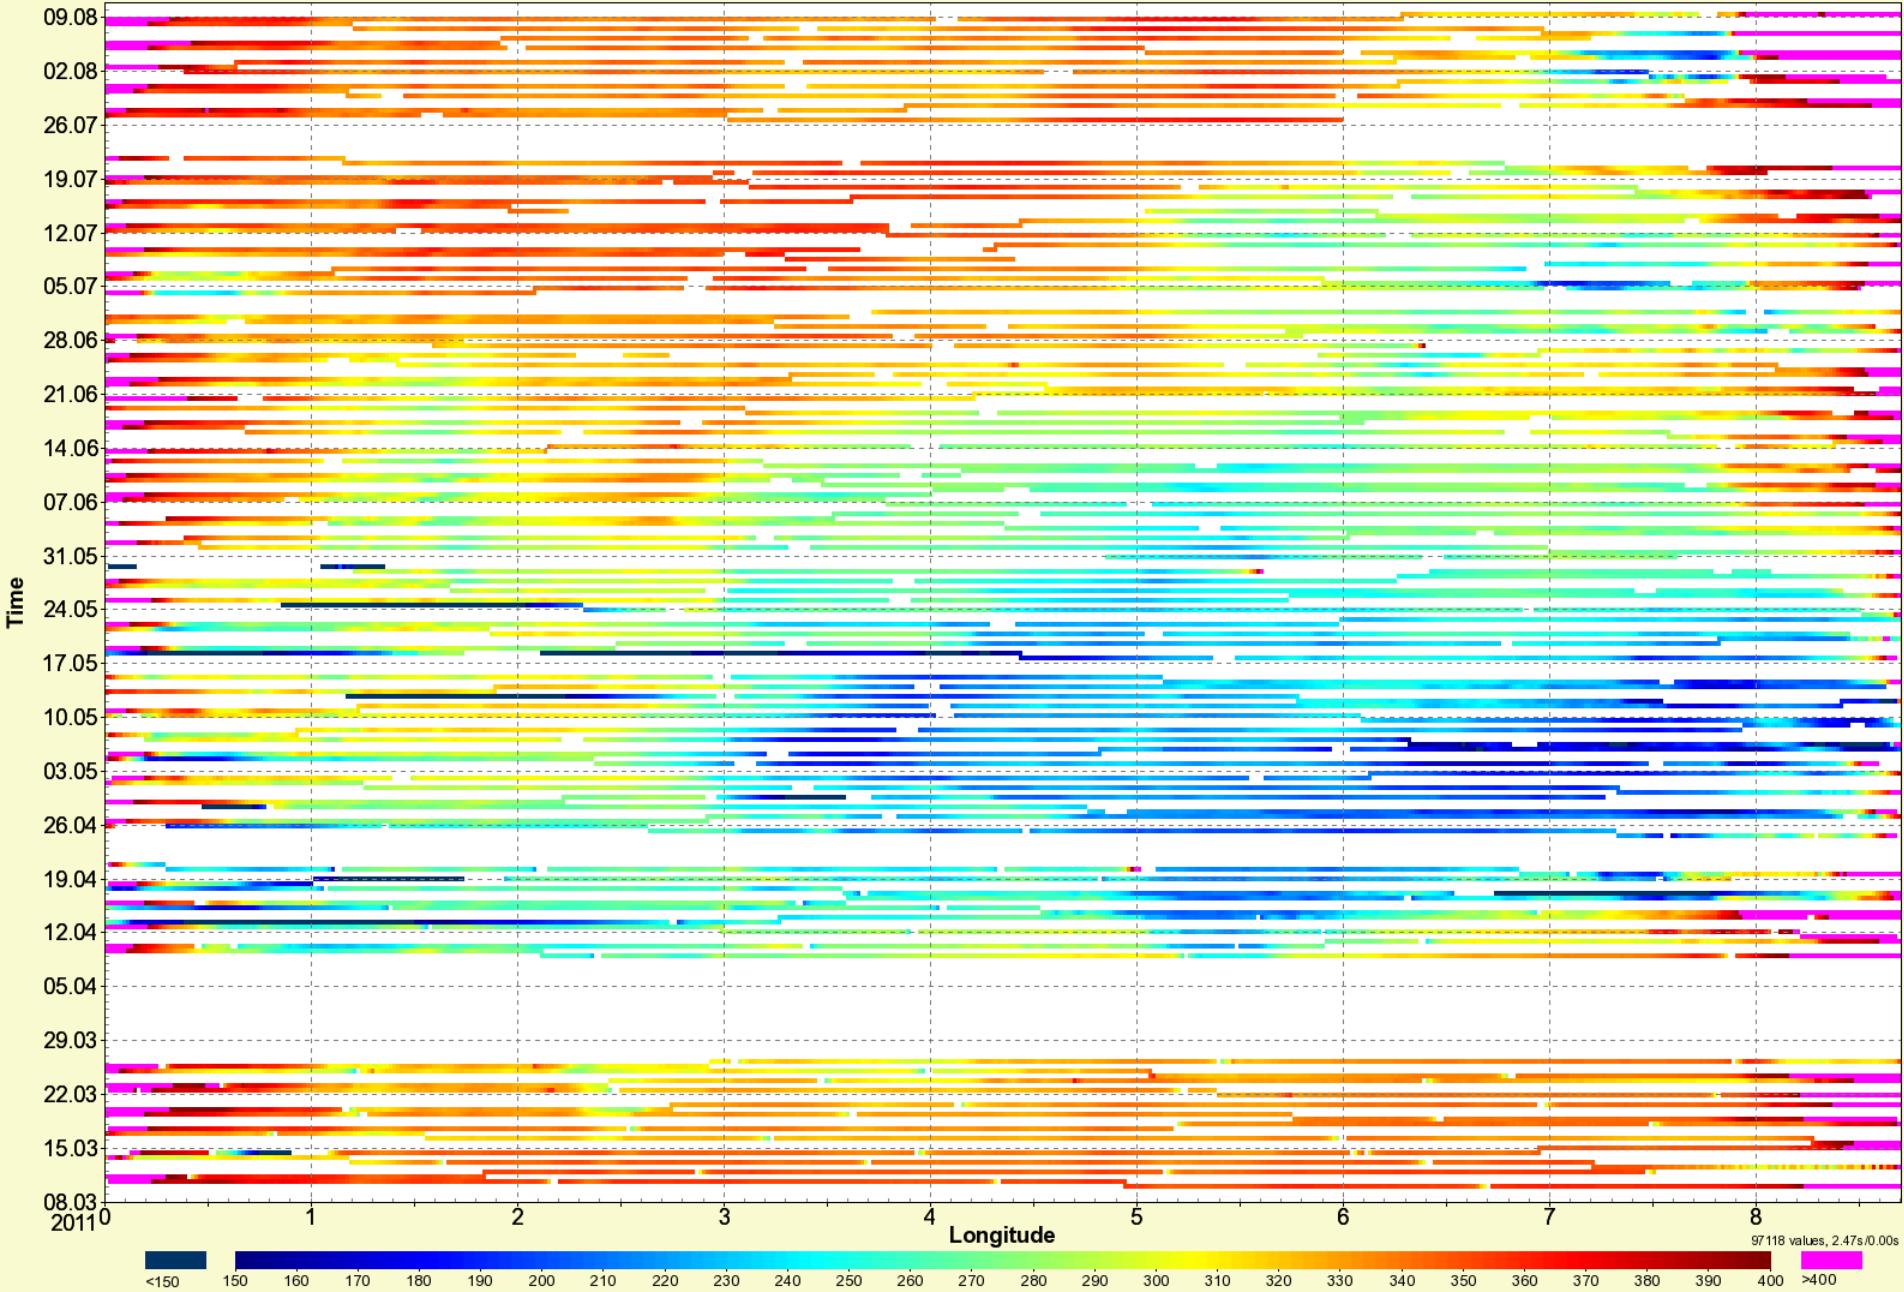

- HydroC™-FT integrated into the FB's on the roll-on/roll-off ship *TorDania* and on the cargo ship *LysBris*

Summary and outlook

- $p\text{CO}_2$ and $c\text{CH}_4$ are parameters of increasing interest that are monitored within multiple applications and on various platforms.

HydroC's:

- Reliability proven during many missions and on various platforms 376 mm
 - More than one year of continuous data of HydroC™-FTs in FB's
 - Usage of acid as an anti fouling mean proved a positive effect → pH change influence
- Individually in-situ calibrated, fast and including drift correction means
- Continue with data analysis and processing optimization
- New version of the underwater sensor released in October; FT will follow:
 - Smaller, faster, programmable sleep-mode, ...

Thank you!
