

# A Comparison of the Influence of Different Multi-Core Processors on the Runtime Overhead for Application-Level Monitoring

Multicore Software Engineering, Performance, and Tools 2012

Jan Waller and Wilhelm Hasselbring — 31.05.12

Christian-Albrechts-University Kiel  
Software Engineering Group  
 [se.informatik.uni-kiel.de](http://se.informatik.uni-kiel.de)

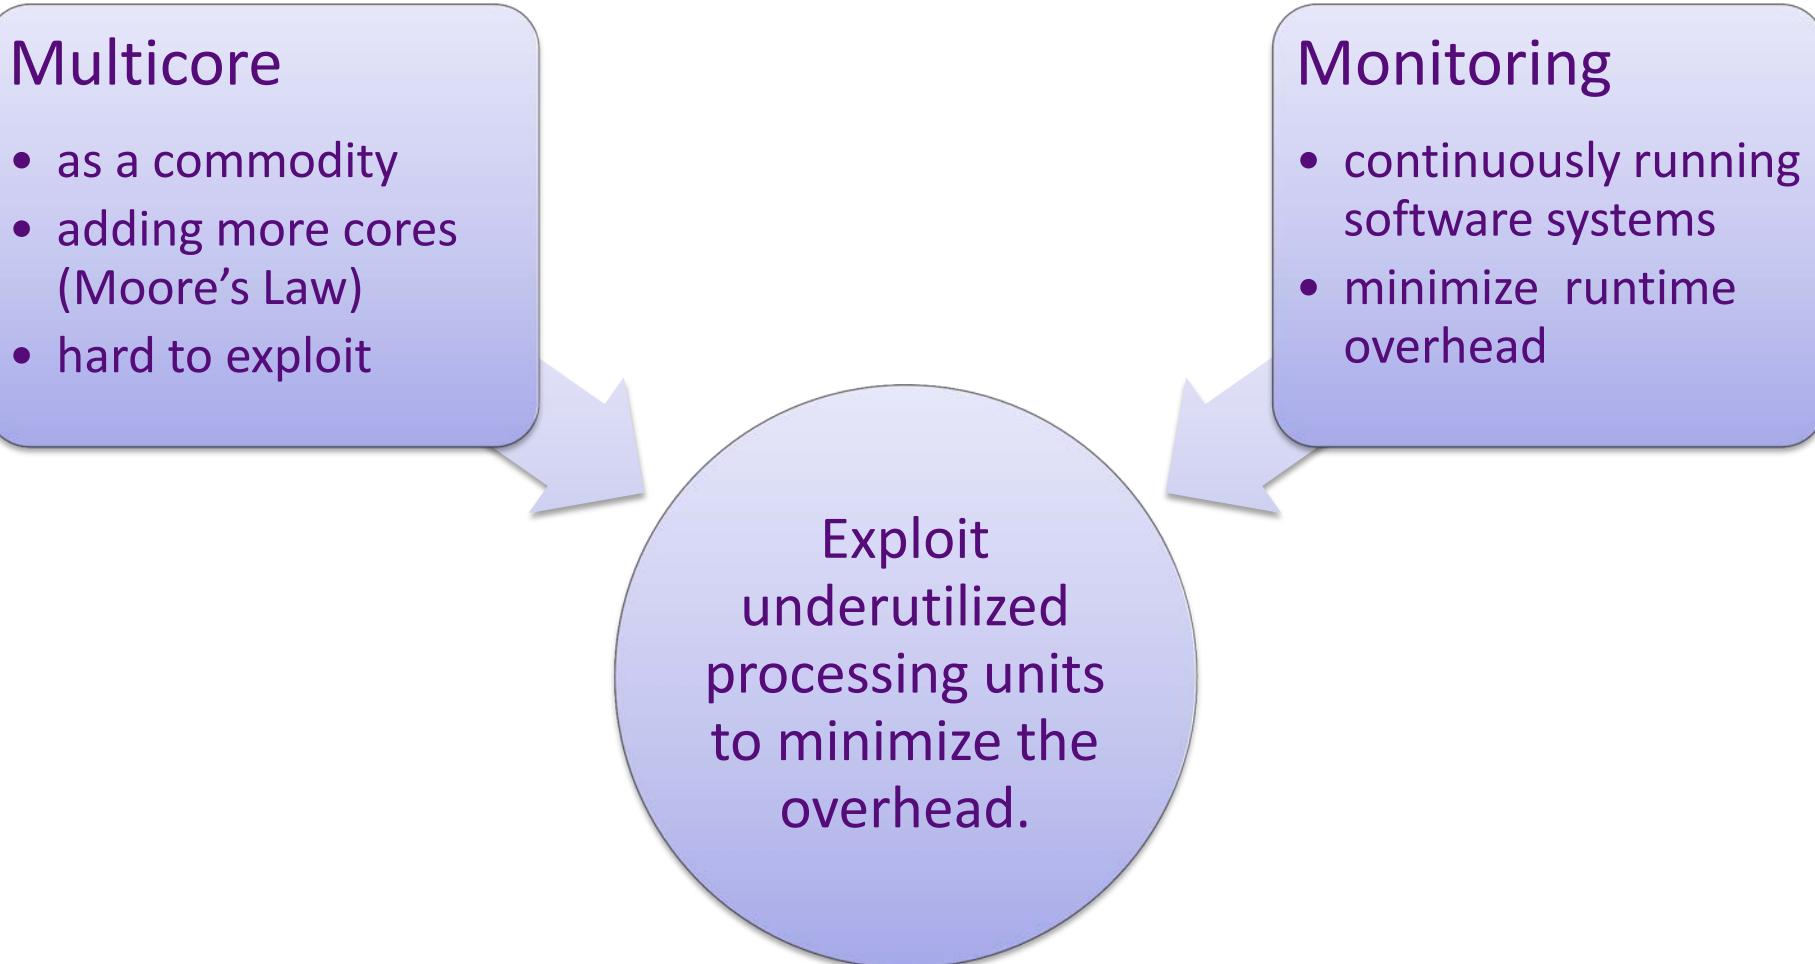

## Multicore

- as a commodity
- adding more cores (Moore's Law)
- hard to exploit

## Monitoring

- continuously running software systems
- minimize runtime overhead

Exploit underutilized processing units to minimize the overhead.

The diagram consists of three main components. On the left is a light blue rounded rectangle containing the word "Multicore" and a bulleted list. On the right is another light blue rounded rectangle containing the word "Monitoring" and a bulleted list. Both rectangles have arrows pointing towards a central light blue circle. The circle contains the text "Exploit underutilized processing units to minimize the overhead.".

1. Kieker Monitoring Framework

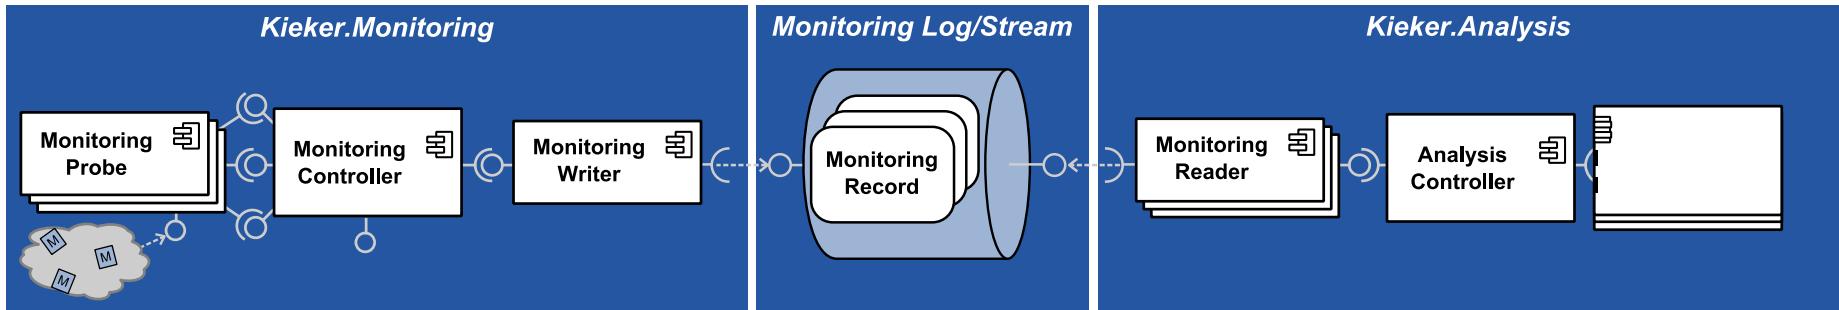

2. Portions of Monitoring Overhead

3. Micro-Benchmarks

4. Results of Benchmarks

5. Future Work and Outlook

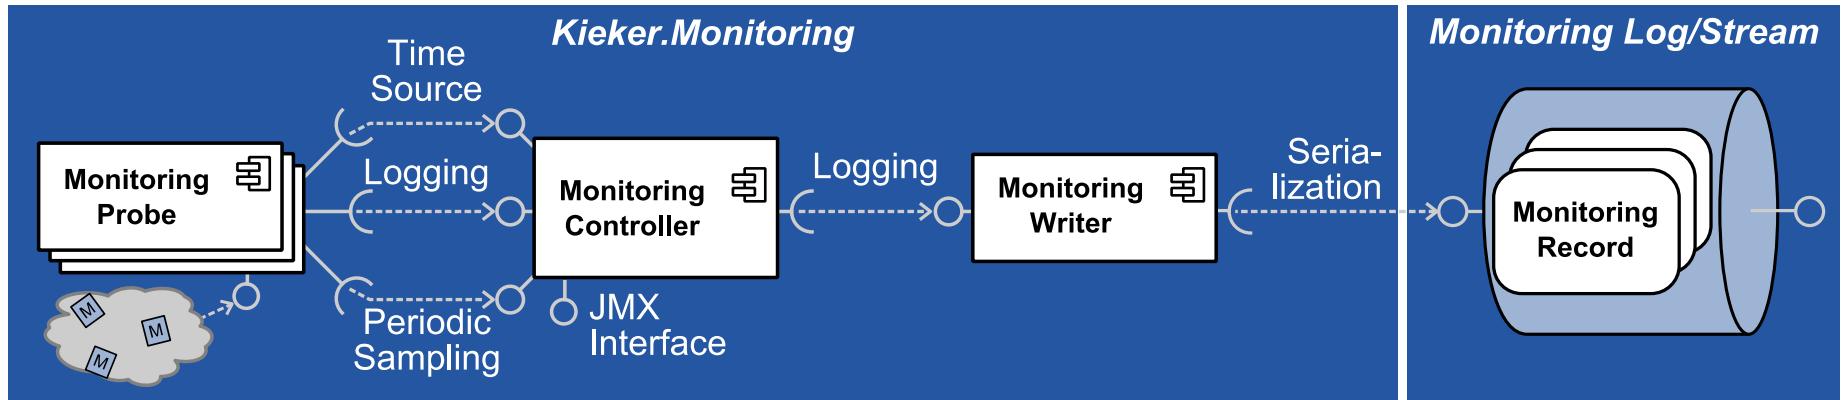

# Kieker Monitoring Framework

## Extensible framework

- for Monitoring and Analyzing runtime behavior of concurrent or distributed software systems at the application level
- provides
  - software instrumentation
  - collection of information
  - logging of collected data
  - analysis/visualization of data

# Kieker Monitoring Framework

Focus on the *Kieker.Monitoring* component:

1. Instrumentation
2. Data Collection
3. Writing

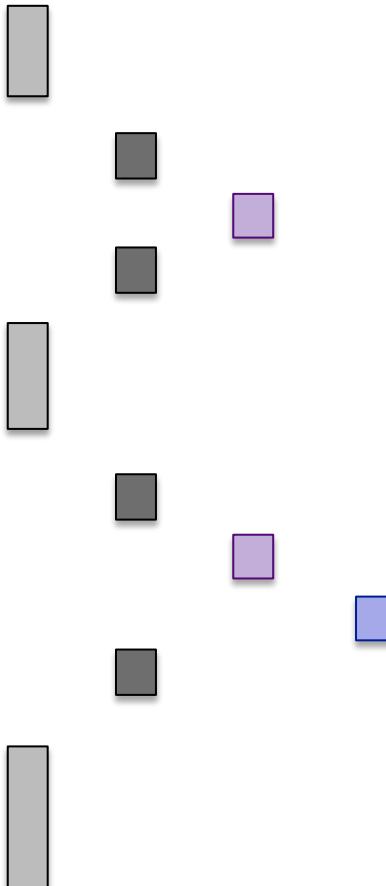

# Monitoring Overhead

## Overhead

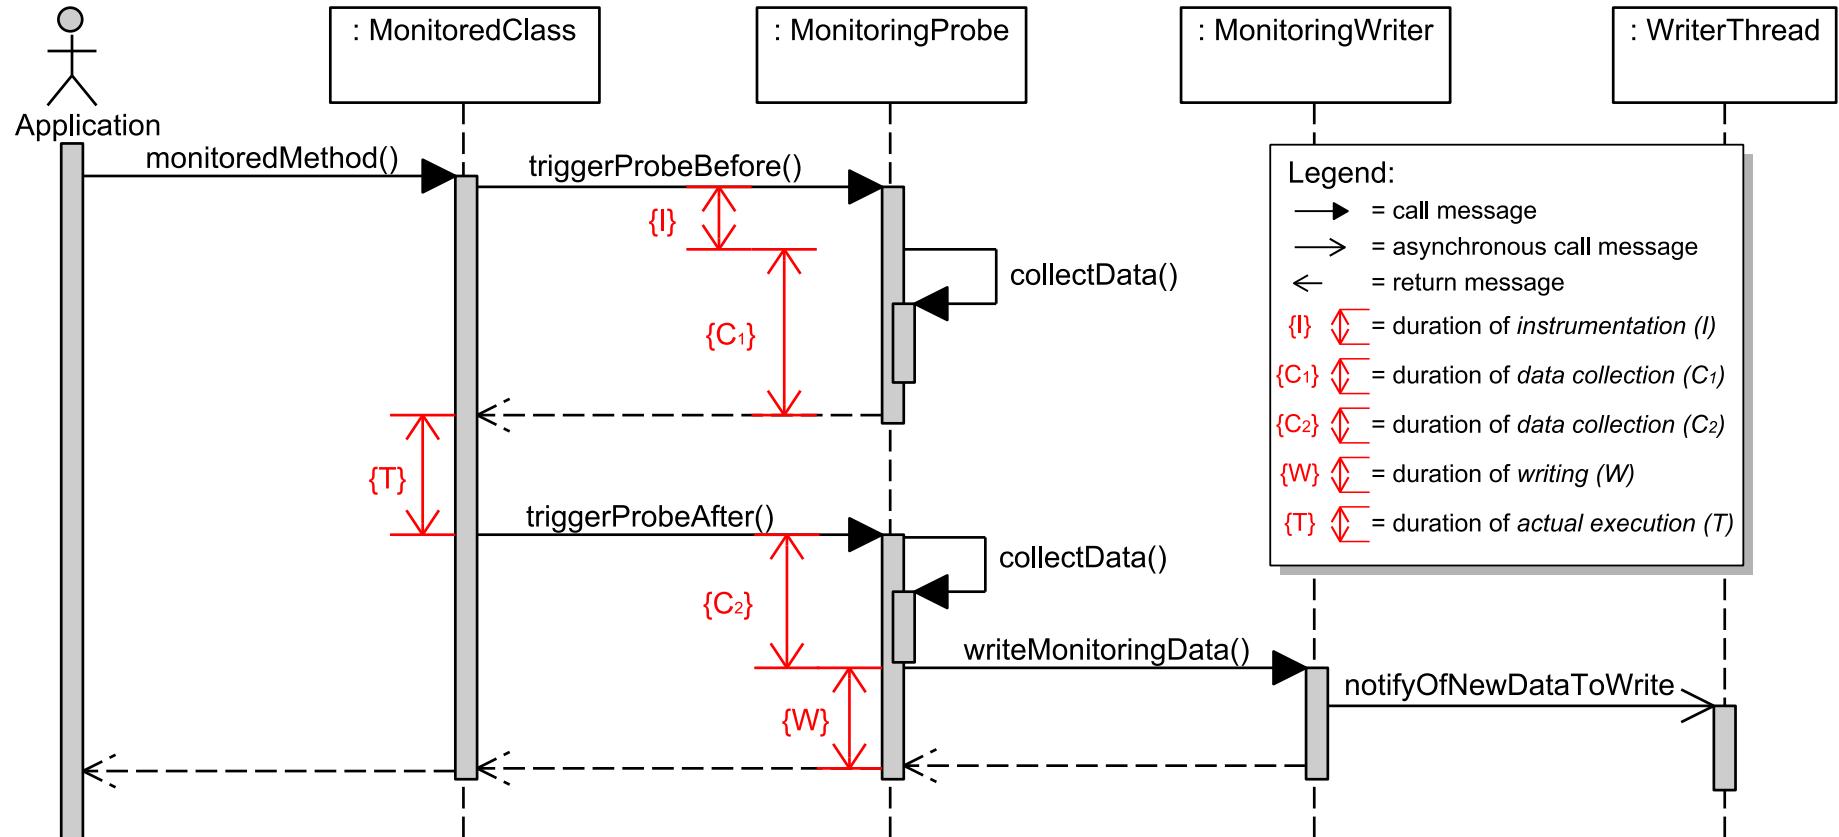

$T$     $I$     $C$     $W$

(Simplified) source code of a monitored method

```
public boolean monitoredMethod() {  
  
    if (!isMonitoringEnabled()) {  
        collectDataBefore();  
    }  
  
    // normal method code  
  
    if (!isMonitoringEnabled()) {  
        collectDataAfter();  
        writeMonitoringData();  
    }  
  
    return retVal;  
}
```

# Monitoring Overhead

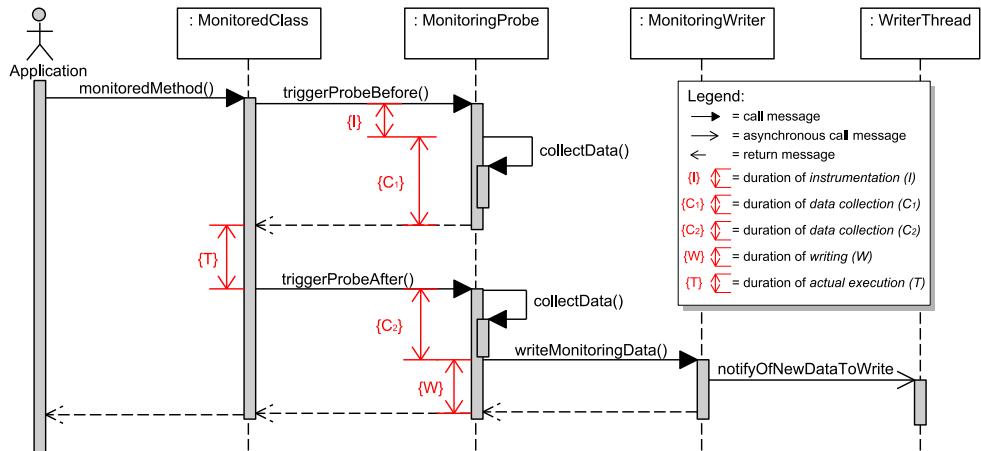

Execution time:  $T$

Overhead:  $I + C + W$

with  $C = C_1 + C_2$

## 3 Portions of Overhead

$$I + C + W$$

Determine each portion (one at a time):

1. Determine  $T$  in the benchmark system
2. Add instrumentation  $I$
3. Add data collection  $C$
4. Add writing  $W$

1. Kieker Monitoring Framework

2. Portions of Monitoring Overhead

3. Micro-Benchmarks

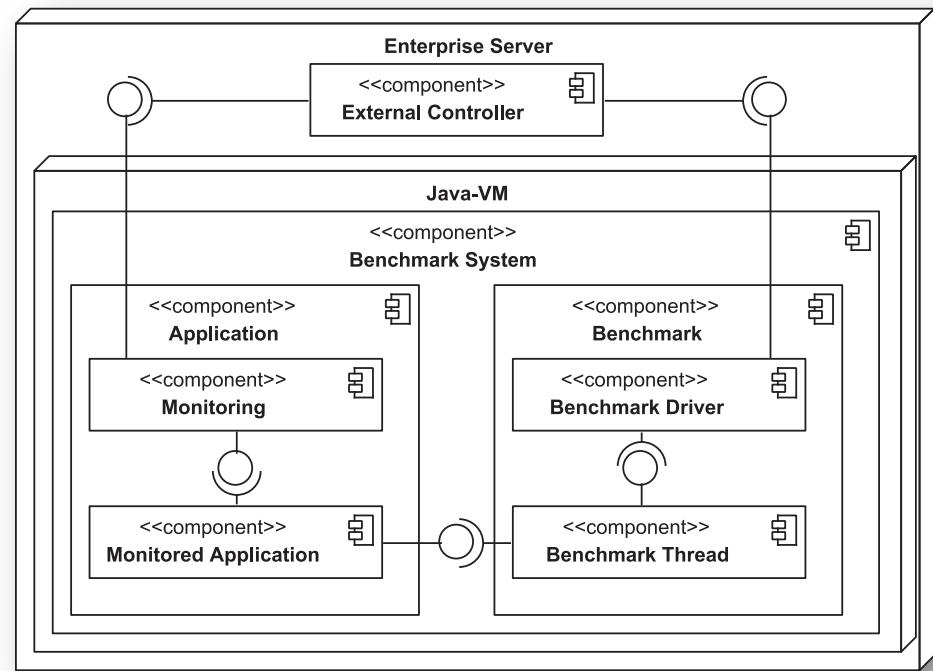

4. Results of Benchmarks

5. Future Work and Outlook

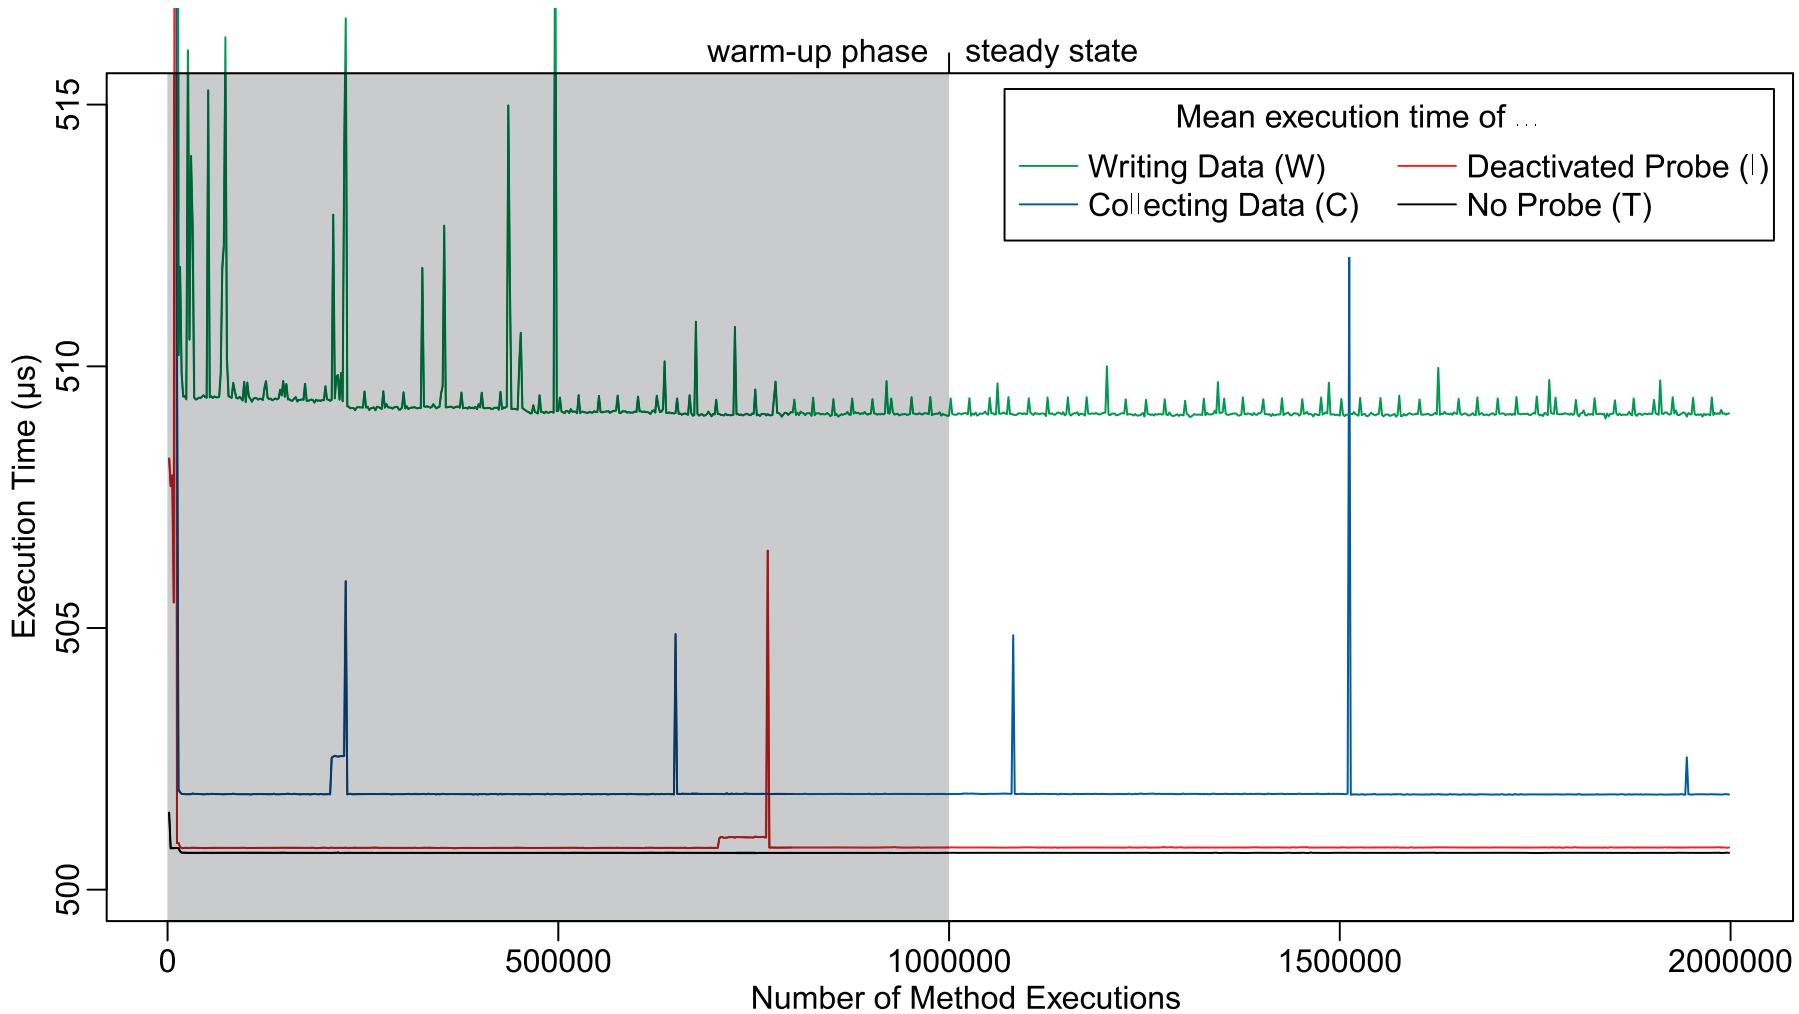

Benchmark designed to measure individual portions

- *External Controller* configures *Monitoring* and *Driver*
- *Monitored Application* provides fixed  $T$
- *Benchmark Threads*
  - call *monitored method*
    - #totalCalls
    - #recodedCalls
- Run 4 times to measure

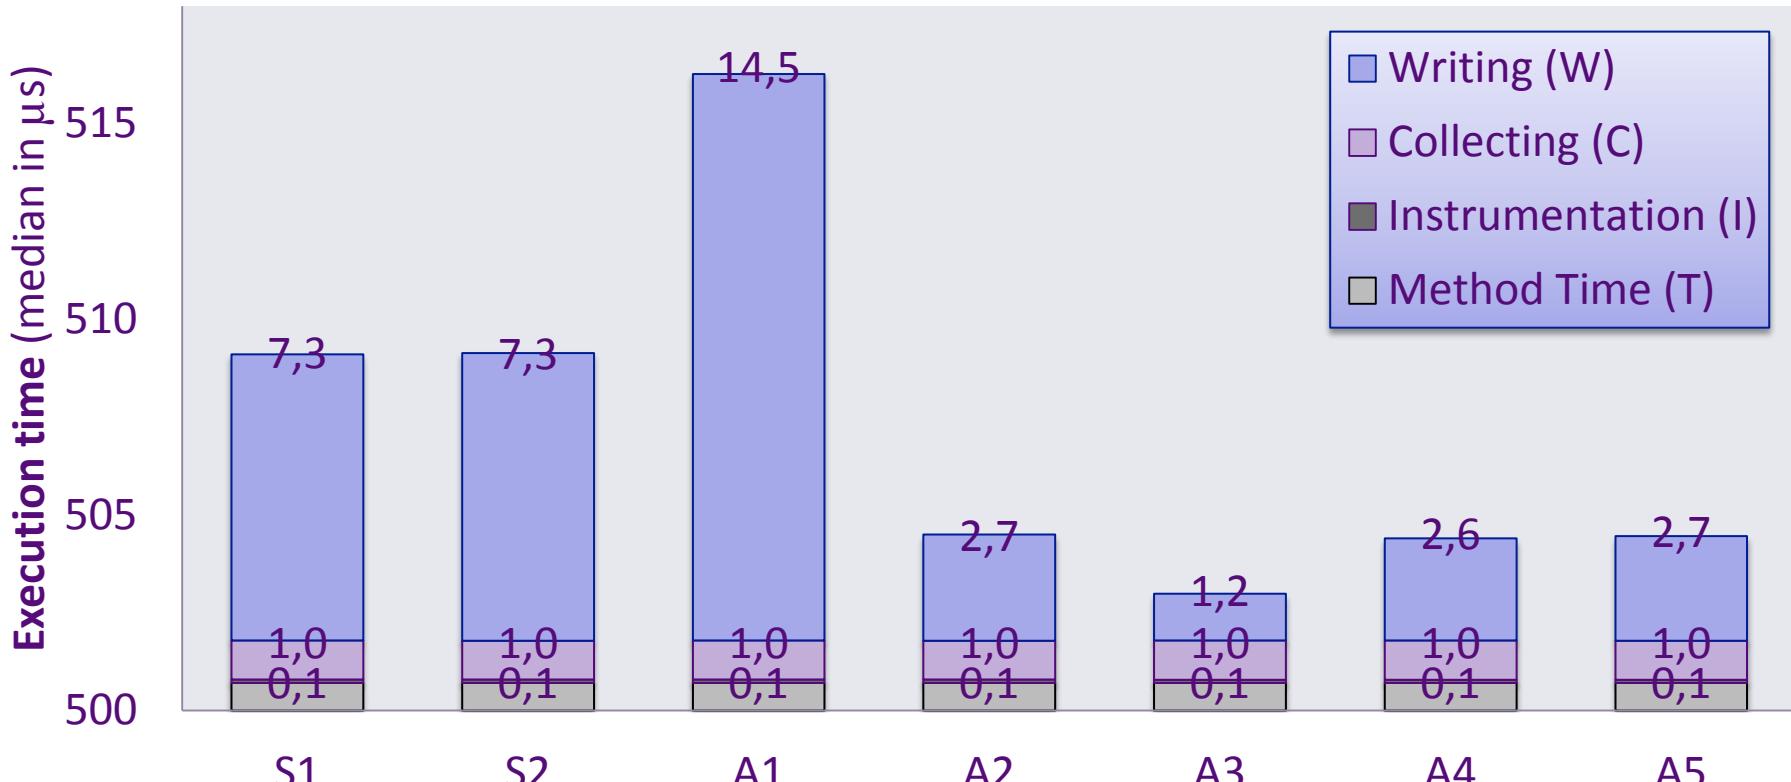

complete source code available at:

# Benchmark – Warm-up Phase

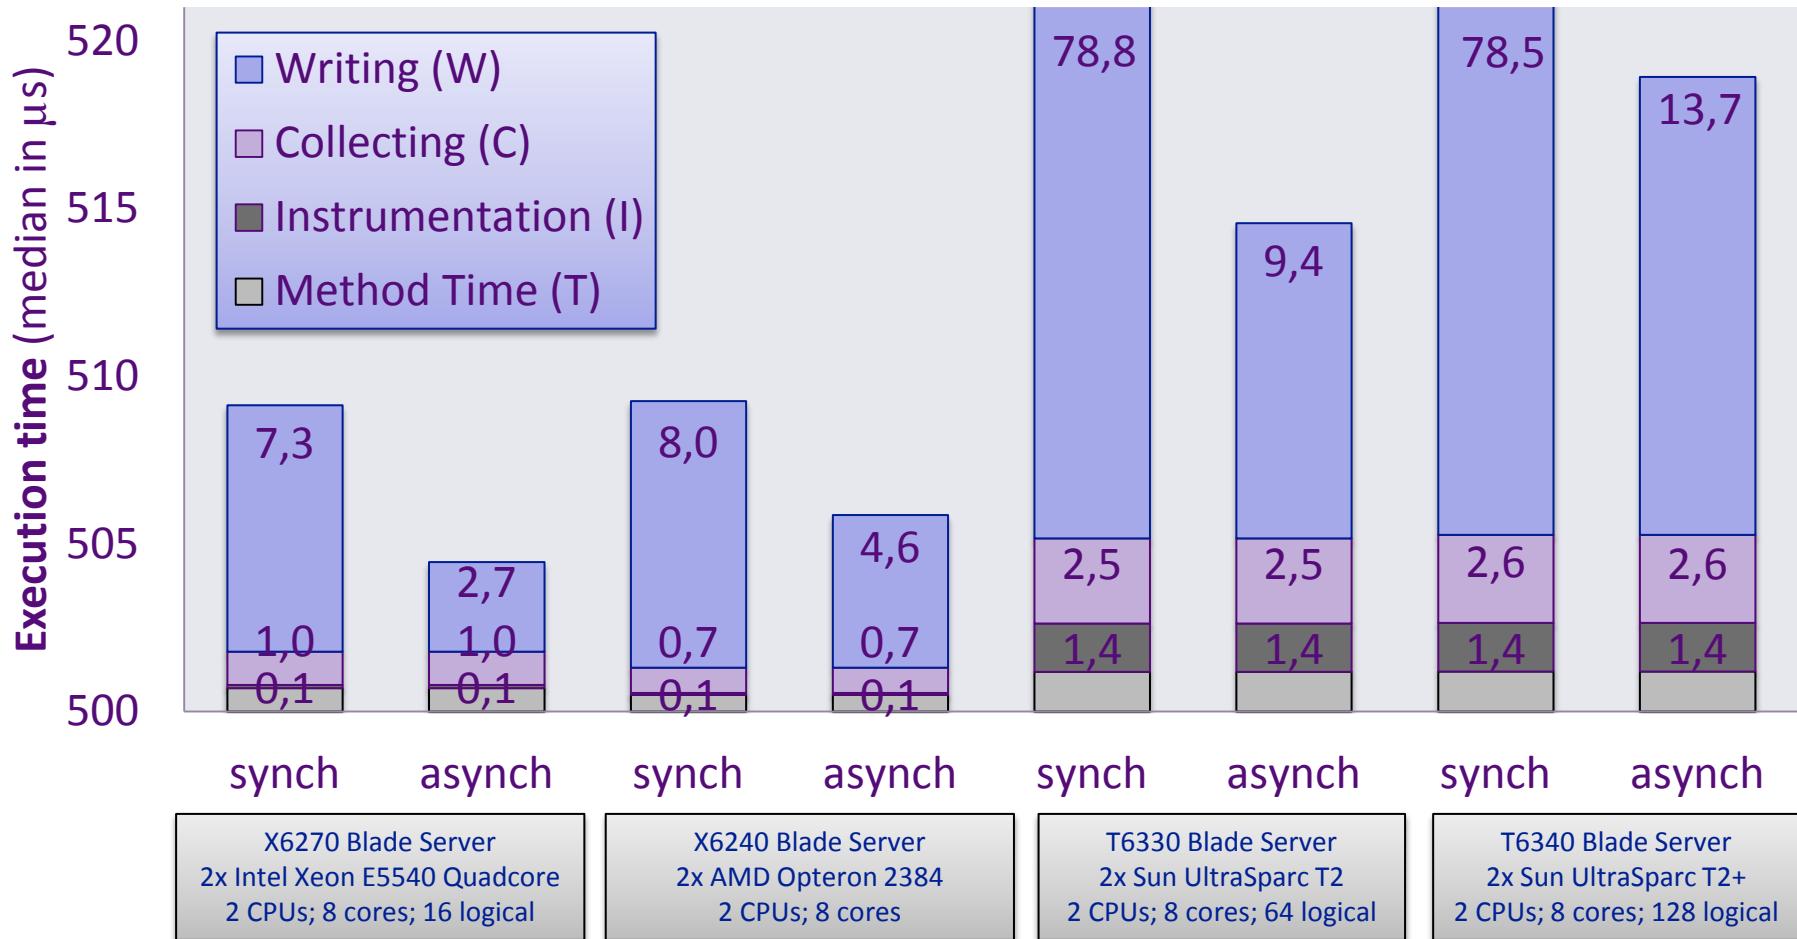

# Single Threaded Benchmark

Exp	Writer	Cores	Notes	Exp	Writer	Cores	Notes
S1	SyncFS	1	single physical core	A1	AsyncFS	1	single physical core
S2	SyncFS	2	two logical cores on the same physical core	A2	AsyncFS	2	two logical cores on the same physical core
<b>X6270 Blade Server</b>							
2x Intel Xeon 2.53 GHz E5540 Quadcore / 24 GB RAM							
Solaris 10 / Oracle Java x64 Server VM 1.6.0_26 (1 GB heap)							

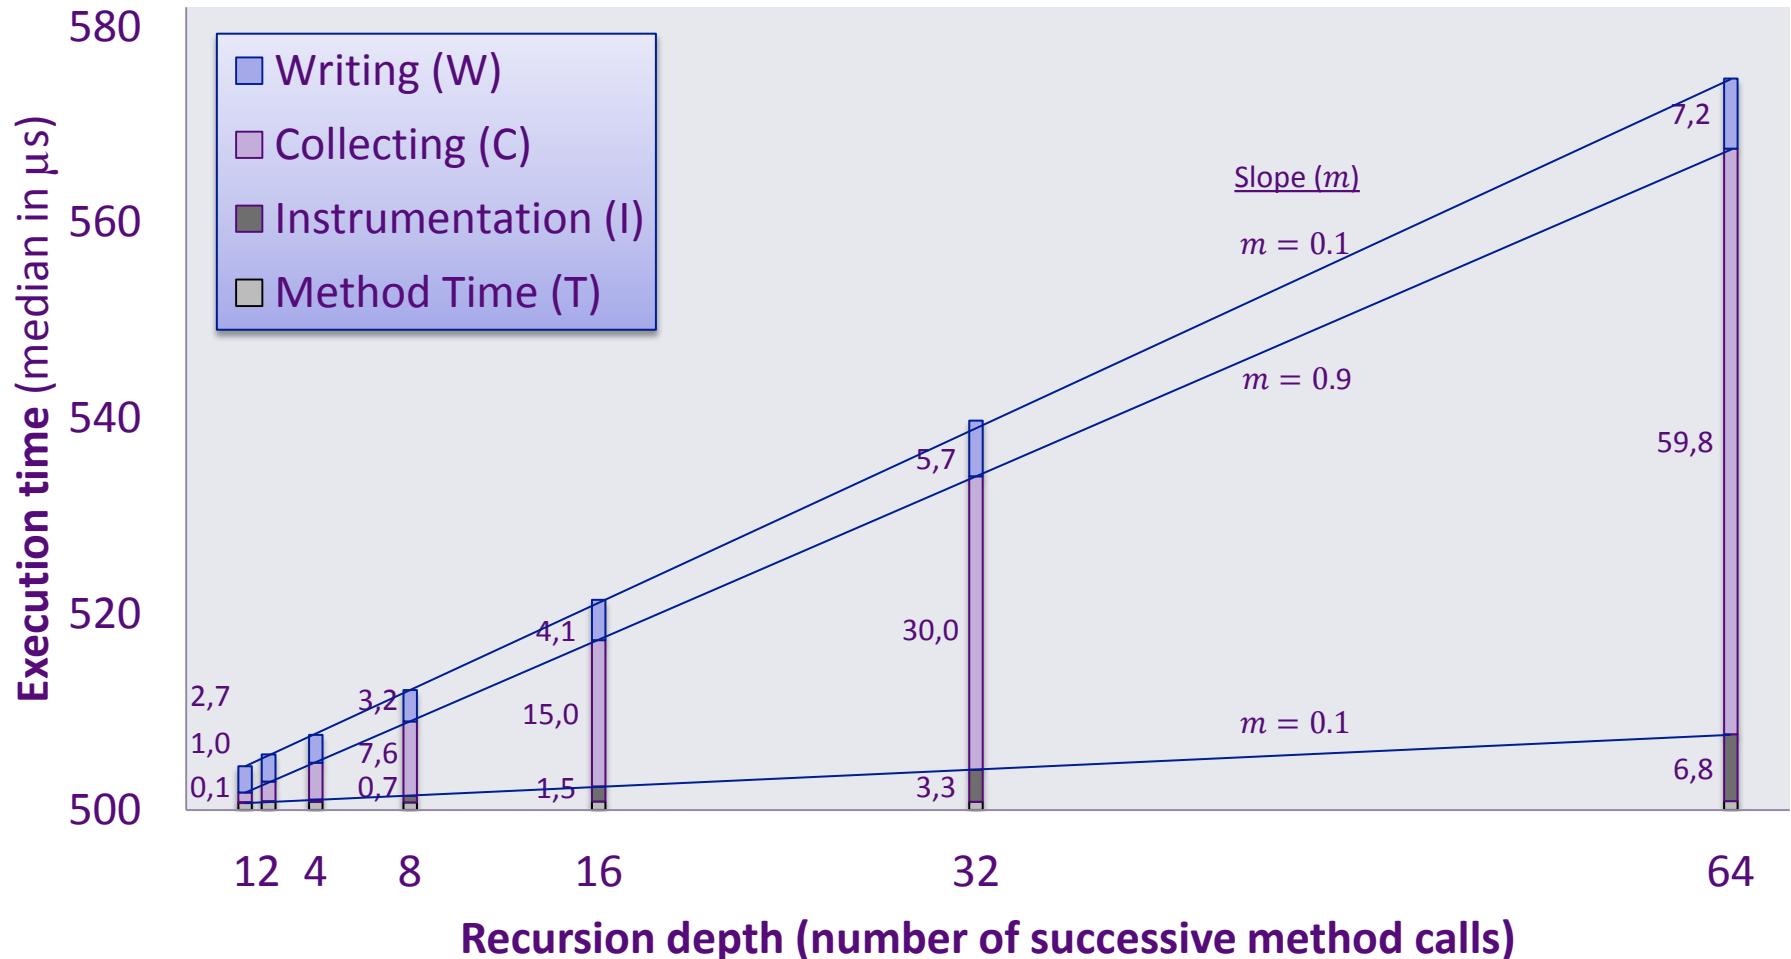

# Multi-Core Architectures

Experiment similar to:

S2	SyncFS writer	all cores	whole system is available
A5	AsyncFS writer	all cores	whole system is available

# Linear Rise of Overhead

Experiment similar to:

A5      AsyncFS writer

16 cores

whole system is available

1. Kieker Monitoring Framework

2. Portions of Monitoring Overhead

3. Micro-Benchmarks

4. Results of Benchmarks

5. Future Work and Outlook

# Future Work

- Publish results on multi-threaded benchmarks
  - $\# \text{threads} < \text{cores}$
  - $\# \text{threads} = \text{cores} - 1$
  - $\# \text{threads} = \text{cores}$
  - $\# \text{threads} > \text{cores}$
- Perform macro-benchmark evaluations
  - e.g., SPECjEnterprise2010, ...
- Compare results of other monitoring frameworks
- Establish a benchmark suite in the community

Performance breakpoints  
 $\# \text{threads} = \text{physical cores} - 1$   
 $\# \text{threads} = \text{logical cores} - 1$

```
public long monitoredMethod(final long methodTime) {  
    final long exitTime = System.nanoTime() + methodTime;  
    long currentTime = System.nanoTime();  
    while (currentTime < exitTime) {  
        currentTime = System.nanoTime();  
    }  
    return currentTime;  
}  
  
for (int i = 0; i < totalCalls; i++) {  
    start_ns = System.nanoTime();  
    mc.monitoredMethod(methodTime);  
    stop_ns = System.nanoTime();  
    timings[j] = stop_ns - start_ns;  
    j = (j + 1) % recordedCalls;  
}
```

(simplified) source code of the micro-benchmark  
included in the Kieker releases (<http://kieker-monitoring.net>)

# Monitoring Log Size

each Experiment:

- 20 minutes / configuration
- 2,000,000 monitored calls
- 362 MB Kieker monitoring log files

Recursion depth 64:

- 23 GB monitoring log files
- 19.3 MB/s written to disc
