Vertical acoustic blanking in seismic data from the German North Sea: a spotlight to shallow gas-bearing incised channels

Niklas Ahlrichs¹, Axel Ehrhardt¹, Michael Schnabel¹, Christian Berndt²

¹ Federal Institute for Geosciences and Natural Resources (BGR), Stilleweg 2, 30655 Hannover, Germany.
² Geomar Helmholtz-Zentrum für Ozeanforschung Kiel, Wischhofstrasse 1-3, 24148 Kiel, Germany.

S2: Locations of vertical acoustic blanking across the German North Sea identified on industry and academic 2D and 3D seismic data:

In total, 30 occurrences of vertical acoustic blanking were identified, which were categorized based on their characteristics, correlation with shallow structures and the data quality imaging the anomaly. Please refer to the main text for further information. Images of all identified blanking anomalies are provided in the following.

ID: 001

GeoBasis3D - ILINE 409

Vertical acoustic blanking
- Shallow channel (proven by 3D-data)
- Possible shallow channel (2D data only)
- Shallow part unsure

ID: 002
